Whose knowledge? Whose learning?

• Talk about working with social movements
• The ways in which they have developed their learning
• The ways in which this learning is developing
• The ways in which learning is co-produced with academic institutions
• What might this mean for academics in the future
Learning as a process

• Process of acquiring information and turning it into knowledge and the ability to use knowledge
• Process of building relationships that enable this process to move forward urban development to be inclusive and pro-poor
• Partly a process of defining what is visible (as defined by grassroots groups...),
• But also a process of identifying what is possible... the action/reflection iteration
Central to what I talk about is

- The problems with poor quality information and knowledge

- The problems with the professionalization of knowledge (knowledge segregation and stratification)

- The problems arising from social stratification, and the de-legitimation of low-income and informal
The context

• One in seven living in informal settlements without adequate access to basic services, safe and secure housing, and/or secure tenure
• Very significant resources and policies to address this – but limited success
• Many policies unhelpful – even if well-intentioned
• Major shortcomings in our understanding about what might address this situation (evidenced by continuing poverty and inequality in the global North)
SDI introduction

• Network of savings groups, federations at the city and national level. From 1996 linked at the international level as well.
• Learning a critical component from the beginning
• Learning about the scale of problems
• Learning about the nature of solutions
• Learning as empowerment – “fuelled” by community to community exchanges
• Strategy one: knowledge as process - community exchanges, alliance building
• Strategy two: knowledge content (next slide)
* www.sdinet.org
Problem 1: the need to know

- Knowledge about the situation in their settlements and cities
- Knowledge about the priorities of local residents
- Knowledge about the kinds of solutions that work for them, and how they might be scaled up
- Knowledge about the agencies involved and their relationships
- Knowledge about the processes involved in such solution scaling
Problem 2: specialise and order

• Professionalization long recognised to be disempowering
• This problem particularly acute in urban areas because of the density of state agencies and standard setting models of local authority actions
• Despite this, the longstanding practices both civil society and local authorities reinforce this
• Processes reinforce knowledge stratifications
• SDI modality of agencies recognises this but sets up a permanent tension
• Counteracted by federating, networking and exchanges

SDI and professional alliances

Five strategies (not exclusive) – all based on the simple reality that professionals do not have the solutions (reverse perspective, do not need to know)

• Keep professionals at a distance
• Better training and selection
• Keep professionals focussed on particular areas
• Hold professionals to account
• Transform professional education
Problem 3: legitimate new knowledge agencies

- Collect basic data - “Know your city”
- Use the data collection to build alliances WITHIN low income settlements, and establish priorities
- Use the data collection to legitimate contribution of the urban poor – DRAW in local authorities
- Deepen alliances with local authorities
Also through knowledge coproduction

Also with academic agencies – why?

• Quality: Improves quality of work and therefore acceptability

• Legitimation: of the work of the urban poor – insufficient on their own

• Amplifies voices through knowledge aggregation: validation of concerns and responses

• Improves quality of next generation of professionals
Knowledge aggregations: international legitimation

Process now of standardizing templates to produce consistent global knowledge base. All SDI profiles will follow a core set of questions. Why?

• To address global practices and enable the legitimation of the urban poor to enter a new level
• To address invisibility and practices that reinforce it at scale
• To increase the scale of collectivity AND critical mass
• Know Your City: a global campaign (with UCLG – A) for gathering citywide data on slums as the basis for inclusive partnerships between the urban poor and local government
(Know)
Your City

A Global Campaign for Gathering Citywide Data on Slums as the Basis for Inclusive Partnerships between the Urban Poor and Local Governments.

SDI Urban Poor Federations have a presence in 450 cities and have collected data on over 7,000 informal settlements across the Global South.

Today, over 1 billion people live in slums

2 billion by 2030

3 billion by 2050

In Your City

If the increasing majority of slums remain unaccounted for there can be NO INCLUSIVE DEVELOPMENT planning or investment AND NO EFFECTIVE CITY GOVERNANCE.

© Every household, neighbourhood and informal settlement has to be counted.
What are the implications for academics?

• Still relevant: Two contradictory processes: increasingly defined and constrained knowledge products vs growing sophistication of non-academic knowledge producers
  
• Former has multiple implications: less time to build relations, less time for multiple knowledge products, narrow range of possible questions = will academics be relevant?
  
• Changing knowledge capabilities: Consolidation of (co-productive) relations (at least in the global South). New forms of relationship with local authorities and Southern academics
  
• New demands for greater accountability. Should academics be accountable for what they write? And the processes by which they do research? And the policy direction they suggest?
