The table contains results for HAC SupW tests for structural change in unconditional volatility. Columns headed “#R” contain the number of rejections of the null hypothesis of constant unconditional volatility at the 5% nominal significance level, where the procedure of Hansen (1997) is used to obtain approximate asymptotic p -values. Columns headed “ $\Delta\sigma$ ” contain the median percent change in the unconditional standard deviation for those series for which the SupW test statistic is significant. Numbers in parentheses following the series type denote the number of series tested. Columns headed “L” contain results obtained with a constant unconditional mean. Columns headed “SC” contain results obtained when allowing for a single structural change in the unconditional mean. Columns headed “NL” contain results obtained when allowing for different unconditional means in expansions and recessions. Columns headed “NL-SC” contain results obtained when allowing for expansion-recession nonlinearity and a single structural change during expansions in the unconditional mean.

Table 2: Tests for structural change and nonlinearity in unconditional mean - percent rejections per type

	SC-L	NL	NL-SC

Dividends and volume (3)	2	1	3
Interest rates (11)	0	7	0
Exchange rates (6)	0	0	0
Producer prices (16)	12	9	12
Consumer prices (16)	16	10	16
Miscellaneous (11)	2	8	2
Total (214)	75	132	98

The table contains the number of rejections per type of series at the 5% nominal significance level. The column headed “SC-L” concerns results from HAC SupW tests for a single structural change in the unconditional mean. The column headed “NL” concerns results from Wald tests for different unconditional means in business cycle expansions and recessions, defined using the NBER-dated turning points. The column headed “NL-SC” concerns results from SupW tests for a single structural change in the unconditional mean during expansions. The procedure of Hansen (1997) is used to obtain approximate asymptotic p -values for the structural change tests.

The table contains results for HAC Wald tests for nonlinearity in unconditional volatility. Columns headed “#R” contain the number of rejections at the 5% nominal significance level. Columns headed “ $\Delta\sigma$ ” contain the median percent difference between the unconditional standard deviations in recessions and expansions (as a percentage of the latter) for those series for which the Wald statistic is significant. Columns headed “L” contain results obtained with a constant unconditional mean. Columns headed “SC” contain results obtained when allowing for a single structural change in the unconditional mean. Columns headed “NL” contain results obtained when allowing for different unconditional means in expansions and recessions. Columns headed “NL-SC” contain results obtained when allowing for expansion-recession nonlinearity and a single structural change during expansions in the unconditional mean.

The table contains results for HAC SupW tests for structural change in unconditional volatility during recessions and expansions separately, while allowing these to be different under the null hypothesis. Columns headed “#R_E” (“#R_R”) contain the number of rejections at the 5% nominal significance level of the null hypothesis of constant unconditional volatility during expansions (recessions), where the procedure of Hansen (1997) is used to obtain approximate asymptotic *p*-values. Columns headed “Δσ_E” (“Δσ_R”) contain the median percent change in the unconditional standard deviation in expansions (recessions) for those series for which the SupW test statistic is significant. Columns headed “L” contain results obtained with a constant unconditional mean. Columns headed “SC” contain results obtained when allowing for a single structural change in the unconditional mean. Columns headed “NL” contain results obtained when allowing for different unconditional means in expansions and recessions. Columns headed “NL-SC” contain results obtained when allowing for expansion-recession nonlinearity and a single structural change during expansions in the unconditional mean.

Table 5: Tests for multiple structural changes in unconditional volatility, assuming constant unconditional mean

The table contains results for sequential tests for multiple structural changes in unconditional volatility, when assuming a constant unconditional mean. In the blocks headed “ m change(s)”, $m = 1, 2, 3$, columns headed “#R” contain the number of series for which m changes in variability are found based upon the SupW test, while columns headed “ $\Delta\sigma$ ” contain the median percent “net” change in the standard deviation across these series, that is the difference between the standard deviations after the final change and before the first change. The column headed “Overall - $\Delta\sigma$ ” contain the median percent “net” change in the standard deviation across all series for which at least one change is found. In the blocks headed “Before (After) 1981”, columns headed “#B” contain the number of breaks which is dated before (after) January 1981, while columns headed “ $\Delta\sigma$ ” contain the median percent change in the standard deviation across these breaks.

The table contains results for sequential tests for multiple structural changes in unconditional volatility, when allowing for different unconditional means in recessions and expansions, and for a single structural change during expansions. In the blocks headed “ m change(s)”, $m = 1, 2, 3$, columns headed “#R” contain the number of series for which m changes in variability are found based upon the SupW test, while columns headed “ $\Delta\sigma$ ” contain the median percent “net” change in the standard deviation across these series, that is the difference between the standard deviations after the final change and before the first change. The column headed “Overall - $\Delta\sigma$ ” contain the median percent “net” change in the standard deviation across all series for which at least one change is found. In the blocks headed “Before (After) 1981”, columns headed “#B” contain the number of breaks which is dated before (after) January 1981, while columns headed “ $\Delta\sigma$ ” contain the median percent change in the standard deviation across these breaks.

Table A.1: Tests for structural change in volatility

Results for SupW tests for structural change in unconditional volatility for individual series, when assuming a constant unconditional mean. The column headed σ_0 contains the estimate of the unconditional standard deviation under the null hypothesis. Columns headed σ_1 and σ_2 contain estimates of the unconditional standard deviation before and after the break, respectively. The column headed $\Delta\sigma$ contains the percent change in standard deviation. The estimated break date is given in the column headed τ_v , with the 90% confidence interval for the break date given in brackets. The final column contains the asymptotic p-value of the SupW test. Figures in brackets below parameter estimates are standard errors.

Table A.2: Tests for structural change in mean and volatility

Results for SupW tests for structural change in unconditional volatility for individual series when allowing for a single structural change in the unconditional mean, and SupW tests for structural change in the unconditional mean. The column headed σ_0 contains the estimate of the unconditional standard deviation under the null hypothesis of constant volatility. Columns headed σ_1 and σ_2 contain estimates of the unconditional standard deviation before and after the volatility break, respectively. The column headed $\Delta\sigma$ contains the percent change in standard deviation. The estimated break date for the variance (mean) is given in the column headed τ_v (τ_m), with the 90% confidence interval for the break date given in brackets. The column headed p-value_v (p-value_m) contains the asymptotic p-value of the corresponding SupW test. Figures in brackets below parameter estimates are standard errors.

Table A.3: Tests for nonlinearity in mean and tests for structural change in variance

Results for SupW tests for structural change in unconditional volatility for individual series when allowing for different unconditional means during expansions and recessions, and Wald tests for nonlinearity in the unconditional mean. The column headed σ_0 contains the estimate of the unconditional standard deviation under the null hypothesis. Columns headed σ_1 and σ_2 contain estimates of the unconditional standard deviation before and after the break, respectively. The column headed $\Delta\sigma$ contains the percent change in standard deviation. The estimated break date is given in the column headed τ_v , with the 90% confidence interval for the break date given in brackets. The column headed p-value_v contains the asymptotic p-value of the SupW test. The column headed p-value_{nl} contains the asymptotic p-value of the Wald test for nonlinearity in the unconditional mean. Figures in brackets below parameter estimates are standard errors.

Table A.4: Tests for nonlinearity and structural change in mean and tests for structural change in variance

Results for SupW tests for structural change in unconditional volatility for individual series when allowing for nonlinearity and a single structural change during expansions in the unconditional mean, Wald tests for nonlinearity in the unconditional mean and SupW tests for structural change during expansions in the unconditional mean. The column headed σ_0 contains the estimate of the unconditional standard deviation under the null hypothesis. Columns headed σ_1 and σ_2 contain estimates of the unconditional standard deviation before and after the volatility break, respectively. The column headed $\Delta\sigma$ contains the percent change in standard deviation. The estimated break date for the variance (mean during expansions) is given in the column headed τ_v (τ_m), with the 90% confidence interval for the break date given in brackets. The column headed p-value_v (p-value_m) contains the asymptotic p-value of the corresponding SupW test. The column headed p-value_{nl} contains the asymptotic p-value of the Wald test for nonlinearity during expansions in the unconditional mean. Figures in brackets below parameter estimates are standard errors.

Table A.5: Tests for structural change in expansion volatility

Results for SupW tests for structural change in unconditional volatility during expansions for individual series, when assuming a constant unconditional mean. The columns headed σ_R and σ_0 contain estimates of the unconditional standard deviation during recessions and expansions under the null hypothesis, respectively. Columns headed σ_1 and σ_2 contain estimates of the unconditional standard deviation during expansions before and after the break, respectively. The column headed $\Delta\sigma$ contains the percent change in standard deviation. The estimated volatility break date is given in the column headed τ_v , with the 90% confidence interval given in brackets. The column headed p-value_v contains the asymptotic p-value of the corresponding SupW test. The column headed p-value_{nl} contains the asymptotic p-value of the Wald test for nonlinearity in unconditional volatility. Figures in brackets below parameter estimates are standard errors.

Table A.6: Tests for structural change in recession volatility

Results for SupW tests for structural change in unconditional volatility during recessions for individual series, when assuming a constant unconditional mean. The columns headed σ_E and σ_0 contain estimates of the unconditional standard deviation during expansions and recessions under the null hypothesis, respectively. Columns headed σ_1 and σ_2 contain estimates of the unconditional standard deviation during recessions before and after the break, respectively. The column headed $\Delta\sigma$ contains the percent change in standard deviation. The estimated volatility break date is given in the column headed τ_v , with the 90% confidence interval given in brackets. The column headed p-value_v contains the asymptotic p-value of the corresponding SupW test. The column headed p-value_{nl} contains the asymptotic p-value of the Wald test for nonlinearity in unconditional volatility. Figures in brackets below parameter estimates are standard errors.

Table A.7: Tests for structural change in expansion volatility

Results for SupW tests for structural change in unconditional volatility during expansions for individual series, when allowing for a single structural change in the unconditional mean. The columns headed σ_R and σ_0 contain estimates of the unconditional standard deviation during recessions and expansions under the null hypothesis, respectively. Columns headed σ_1 and σ_2 contain estimates of the unconditional standard deviation during expansions before and after the break, respectively. The column headed $\Delta\sigma$ contains the percent change in standard deviation. The estimated volatility break date is given in the column headed τ_v , with the 90% confidence interval given in brackets. The column headed p-value_v contains the asymptotic p-value of the corresponding SupW test. The column headed p-value_{nl} contains the asymptotic p-value of the Wald test for nonlinearity in unconditional volatility. Figures in brackets below parameter estimates are standard errors.

Table A.8: Tests for structural change in recession volatility

Results for SupW tests for structural change in unconditional volatility during recessions for individual series, when allowing for a single structural change in the unconditional mean. The columns headed σ_E and σ_0 contain estimates of the unconditional standard deviation during expansions and recessions under the null hypothesis, respectively. Columns headed σ_1 and σ_2 contain estimates of the unconditional standard deviation during recessions before and after the break, respectively. The column headed $\Delta\sigma$ contains the percent change in standard deviation. The estimated volatility break date is given in the column headed τ_v , with the 90% confidence interval given in brackets. The column headed p-value_v contains the asymptotic p-value of the corresponding SupW test. The column headed p-value_{nl} contains the asymptotic p-value of the Wald test for nonlinearity in unconditional volatility. Figures in brackets below parameter estimates are standard errors.

Table A.9: Tests for structural change in expansion volatility

Results for SupW tests for structural change in unconditional volatility during expansions for individual series, when allowing for nonlinearity in the unconditional mean. The columns headed σ_R and σ_0 contain estimates of the unconditional standard deviation during recessions and expansions under the null hypothesis, respectively. Columns headed σ_1 and σ_2 contain estimates of the unconditional standard deviation during expansions before and after the break, respectively. The column headed $\Delta\sigma$ contains the percent change in standard deviation. The estimated volatility break date is given in the column headed τ_v , with the 90% confidence interval given in brackets. The column headed p-value_v contains the asymptotic p-value of the corresponding SupW test. The column headed p-value_{nl} contains the asymptotic p-value of the Wald test for nonlinearity in unconditional volatility. Figures in brackets below parameter estimates are standard errors.

Table A.10: Tests for structural change in recession volatility

Results for SupW tests for structural change in unconditional volatility during recessions for individual series, when allowing for nonlinearity in the unconditional mean. The columns headed σ_E and σ_0 contain estimates of the unconditional standard deviation during expansions and recessions under the null hypothesis, respectively. Columns headed σ_1 and σ_2 contain estimates of the unconditional standard deviation during recessions before and after the break, respectively. The column headed $\Delta\sigma$ contains the percent change in standard deviation. The estimated volatility break date is given in the column headed τ_v , with the 90% confidence interval given in brackets. The column headed p-value_v contains the asymptotic p-value of the corresponding SupW test. The column headed p-value_{nl} contains the asymptotic p-value of the Wald test for nonlinearity in unconditional volatility. Figures in brackets below parameter estimates are standard errors.

Table A.11: Tests for structural change in expansion volatility

Results for SupW tests for structural change in unconditional volatility during expansions for individual series, when allowing for nonlinearity and structural change during expansions in the unconditional mean. The columns headed σ_R and σ_0 contain estimates of the unconditional standard deviation during recessions and expansions under the null hypothesis, respectively. Columns headed σ_1 and σ_2 contain estimates of the unconditional standard deviation during expansions before and after the break, respectively. The column headed $\Delta\sigma$ contains the percent change in standard deviation. The estimated volatility break date is given in the column headed τ_v , with the 90% confidence interval given in brackets. The column headed p-value_v contains the asymptotic p-value of the corresponding SupW test. The column headed p-value_{nl} contains the asymptotic p-value of the Wald test for nonlinearity in unconditional volatility. Figures in brackets below parameter estimates are standard errors.

Table A.12: Tests for structural change in recession volatility

Results for SupW tests for structural change in unconditional volatility during recessions for individual series, when allowing for nonlinearity and structural change during expansions in the unconditional mean. The columns headed σ_E and σ_0 contain estimates of the unconditional standard deviation during expansions and recessions under the null hypothesis, respectively. Columns headed σ_1 and σ_2 contain estimates of the unconditional standard deviation during recessions before and after the break, respectively. The column headed $\Delta\sigma$ contains the percent change in standard deviation. The estimated volatility break date is given in the column headed τ_v , with the 90% confidence interval given in brackets. The column headed p-value_v contains the asymptotic p-value of the corresponding SupW test. The column headed p-value_{nl} contains the asymptotic p-value of the Wald test for nonlinearity in unconditional volatility. Figures in brackets below parameter estimates are standard errors.

Table A.13: Tests for multiple structural changes in conditional variance - assuming constant unconditional mean

Results for tests for multiple structural changes in unconditional volatility for individual series, when assuming a constant unconditional mean. The column headed m contains the number of detected changes using the sequential procedure of Bai and Perron (1998). Columns headed σ_j , $j = 1, \dots, 4$ contains the estimate of the unconditional standard deviation between the $(j - 1)$ st and j th break. Figures in brackets below these estimates are standard errors. The estimated break date for the j -th change is given in the column headed $\tau_{v,j}$, with the 90% confidence interval for the break date given in brackets.

Table A.14: Tests for multiple structural changes in conditional variance - allowing for structural change in the unconditional mean

Results for tests for multiple structural changes in unconditional volatility for individual series, when allowing for a single structural change in the unconditional mean. The column headed m contains the number of detected changes using the sequential procedure of Bai and Perron (1998). Columns headed σ_j , $j = 1, \dots, 4$ contains the estimate of the unconditional standard deviation between the $(j-1)$ st and j th break. Figures in brackets below these estimates are standard errors. The estimated break date for the j -th change is given in the column headed $\tau_{v,j}$, with the 90% confidence interval for the break date given in brackets.

Table A.15: Tests for multiple structural changes in conditional variance - allowing for nonlinearity in unconditional mean

Results for tests for multiple structural changes in unconditional volatility for individual series, when allowing for nonlinearity in the unconditional mean. The column headed m contains the number of detected changes using the sequential procedure of Bai and Perron (1998). Columns headed σ_j , $j = 1, \dots, 4$ contains the estimate of the unconditional standard deviation between the $(j - 1)$ st and j th break. Figures in brackets below these estimates are standard errors. The estimated break date for the j -th change is given in the column headed $\tau_{v,j}$, with the 90% confidence interval for the break date given in brackets.

Table A.16: Tests for multiple structural changes in conditional variance - allowing for nonlinearity and structural change during expansions in the unconditional mean

Results for tests for multiple structural changes in unconditional volatility for individual series, when allowing for nonlinearity and structural change during expansions in the unconditional mean. The column headed m contains the number of detected changes using the sequential procedure of Bai and Perron (1998). Columns headed σ_j , $j = 1, \dots, 4$ contain the estimate of the unconditional standard deviation between the $(j - 1)$ st and j th break. Figures in brackets below these estimates are standard errors. The estimated break date for the j -th change is given in the column headed $\tau_{v,j}$, with the 90% confidence interval for the break date given in brackets.

(a) Distribution of percent change in unconditional standard deviation

(b) Distribution of break dates

(c) Scatter of break dates against percent change in standard deviation

Figure 1: Characteristics of unconditional volatility breaks for series for which the SupW statistic is significant at the 5% level, when assuming a constant unconditional mean. In panel (a), series for which the standard deviation more than doubles are collected in the right-most category. In panel (c), series for which the standard deviation more than triples are shown as triangles.

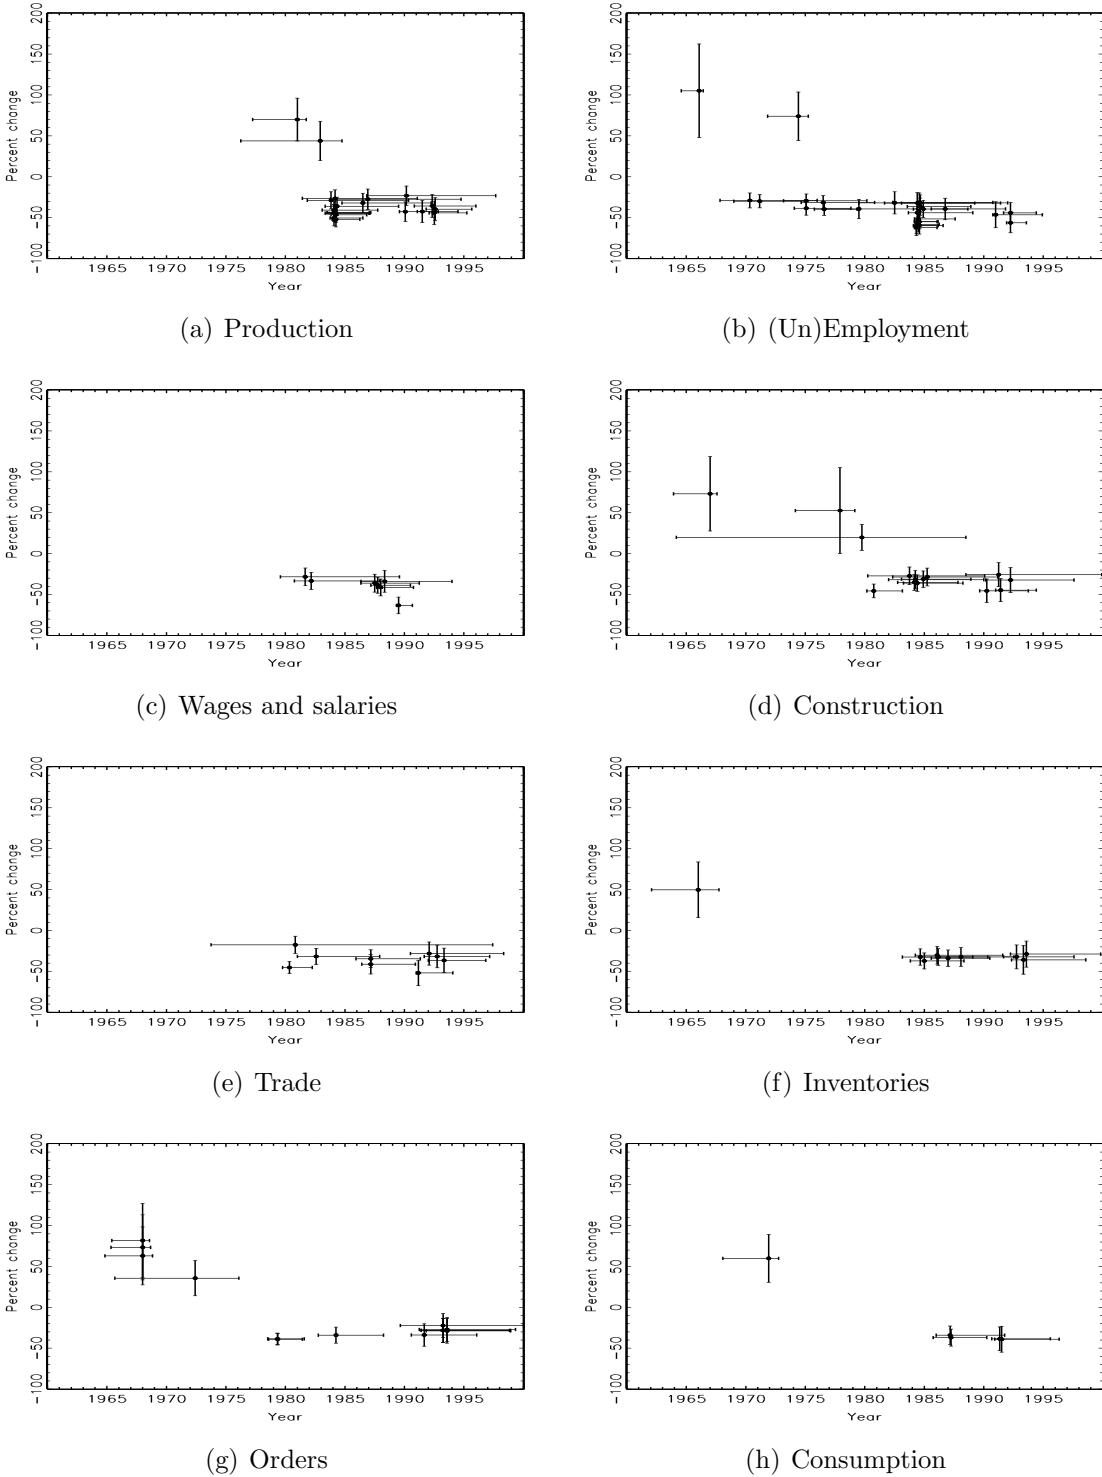

Figure 2: Scatter plots of volatility break dates against percent change in unconditional standard deviation for series for which the SupW statistic is significant at the 5% level, when assuming a constant unconditional mean. 90% confidence intervals for the break date and the percent change in standard deviation are included. Series for which the standard deviation more than triples are shown as triangles.

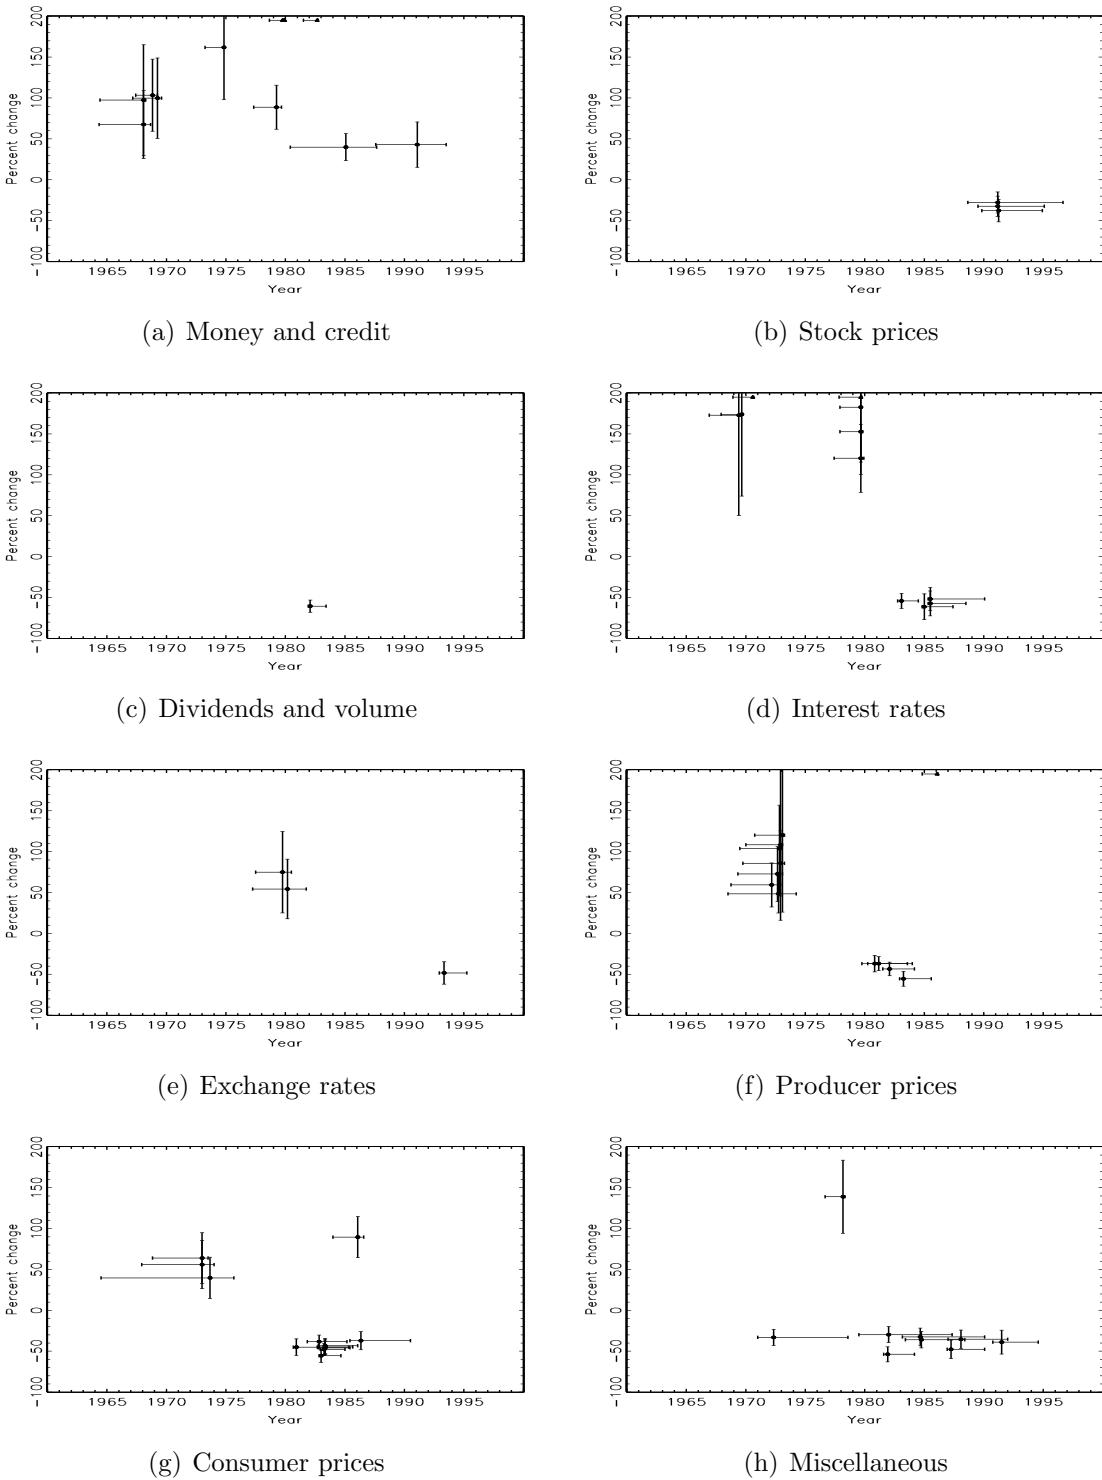

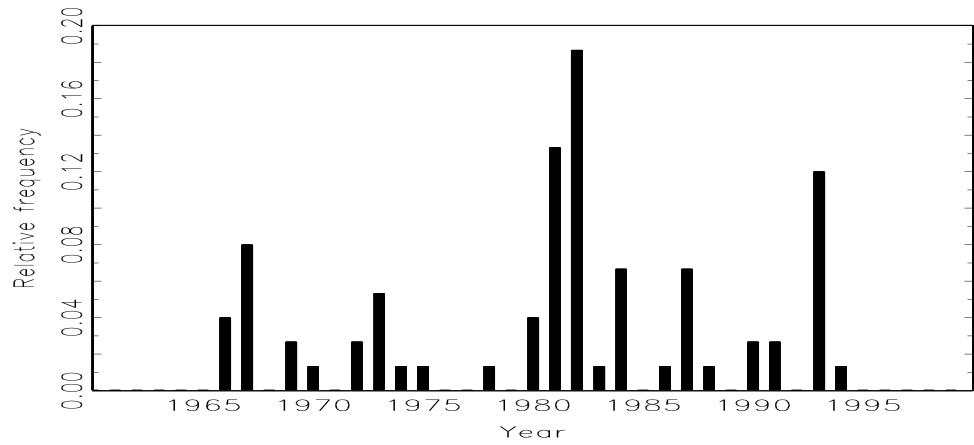

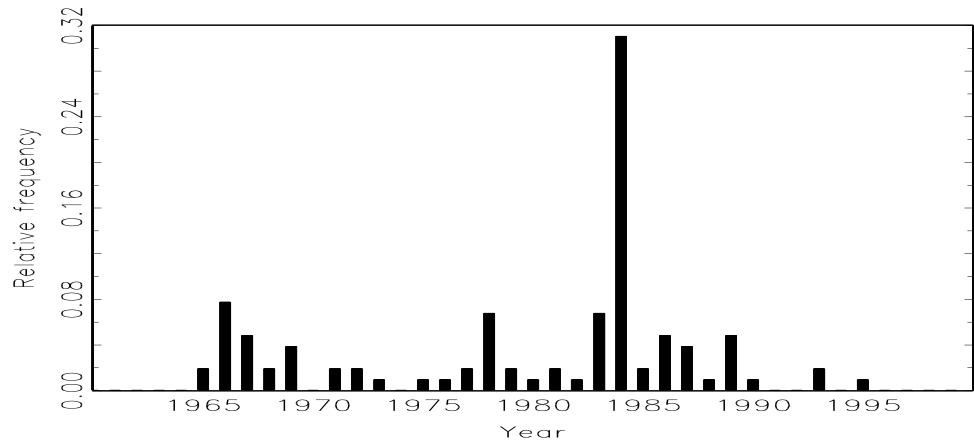

Figure 3: Scatter plots of volatility break dates against percent change in unconditional standard deviation for series for which the SupW statistic is significant at the 5% level, when assuming a constant unconditional mean. 90% confidence intervals for the break date and the percent change in standard deviation are included. Series for which the standard deviation more than triples are shown as triangles.

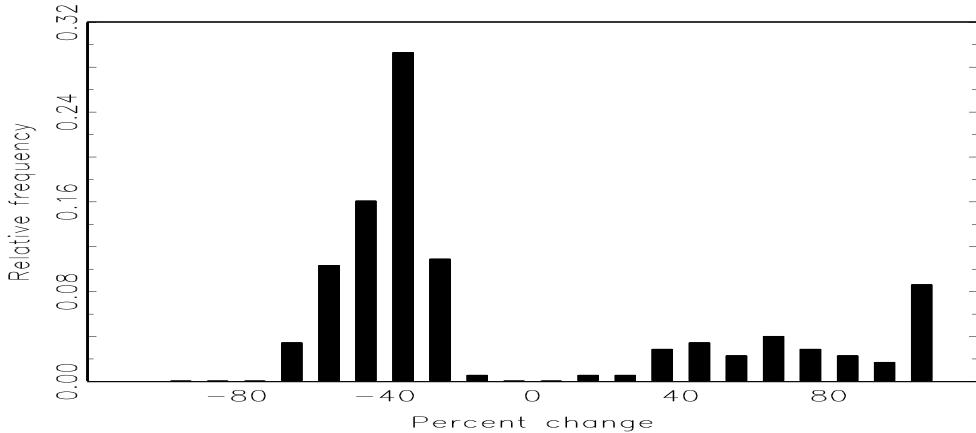

(a) Distribution of break dates in unconditional mean

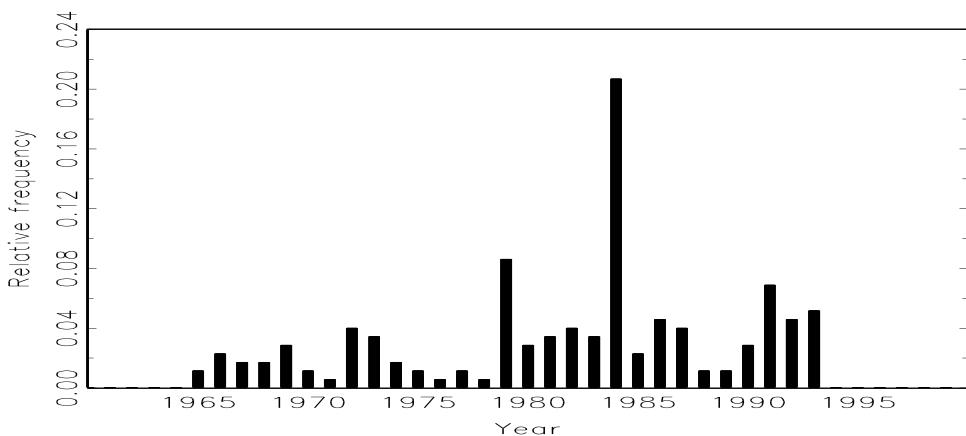

(b) Distribution of break dates in unconditional mean - nonlinear mean

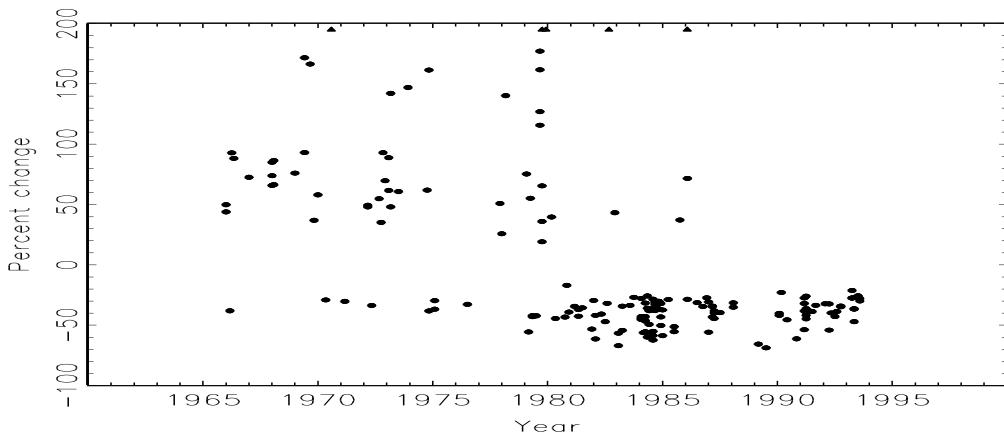

Figure 4: Break dates for series for which the SupW statistic for a structural change in unconditional in a “linear” mean or in the mean during expansions is significant at 5% level.

(a) Distribution of percent change in unconditional standard deviation

(b) Distribution of break dates

(c) Scatter of break dates against percent change in standard deviation

Figure 5: Characteristics of unconditional volatility breaks for series for which the SupW statistic is significant at the 5% level assuming a single structural change in the unconditional mean. In panel (a), series for which the standard deviation more than doubles are collected in the right-most category. In panel (c), series for which the standard deviation more than triples are shown as triangles.

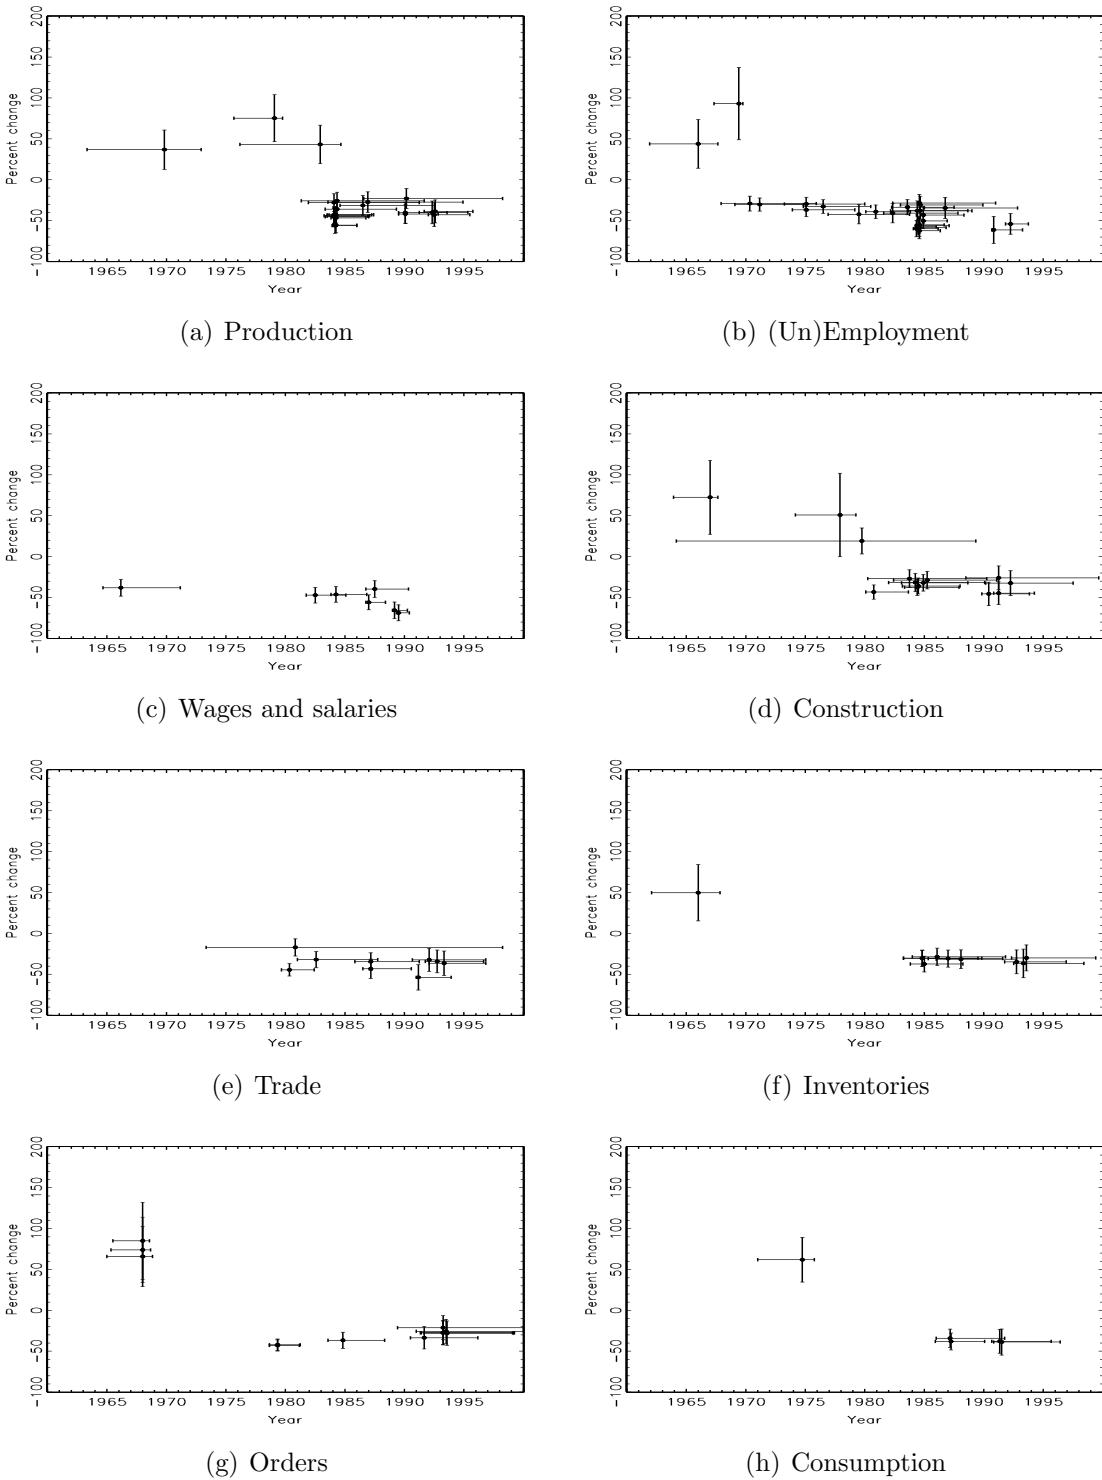

Figure 6: Scatter plots of volatility break dates against percent change in unconditional standard deviation for series for which the SupW statistic is significant at the 5% level, when assuming a single structural change in the unconditional mean. 90% confidence intervals for the break date and the percent change in standard deviation are included. Series for which the standard deviation more than triples are shown as triangles.

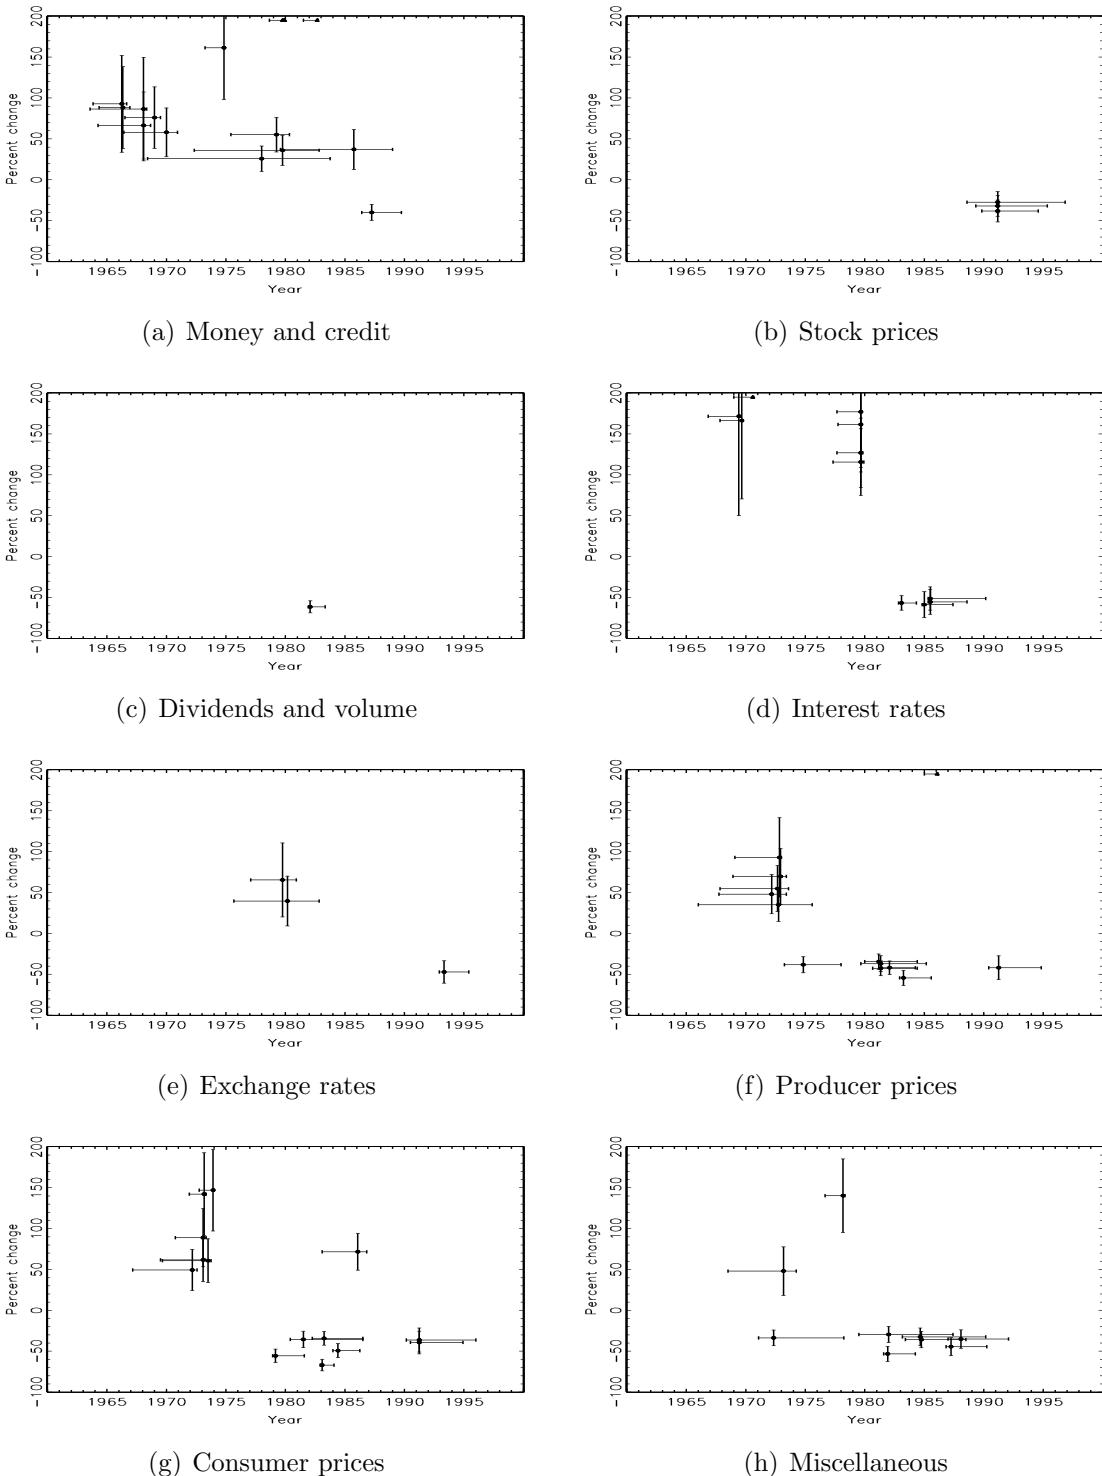

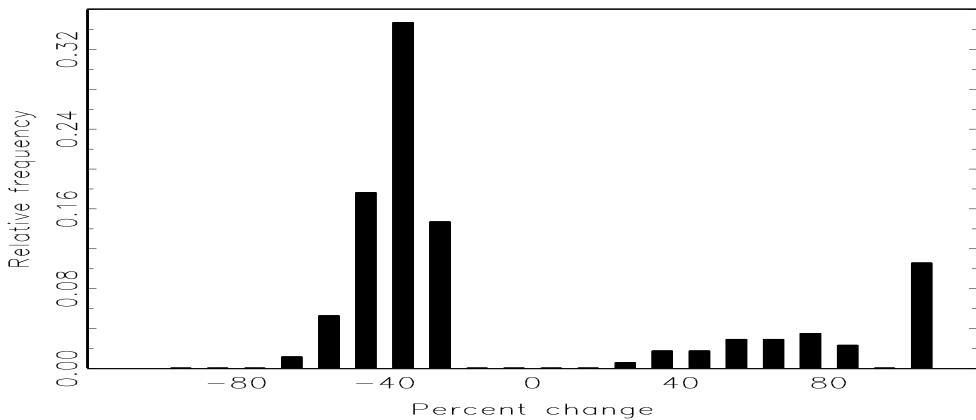

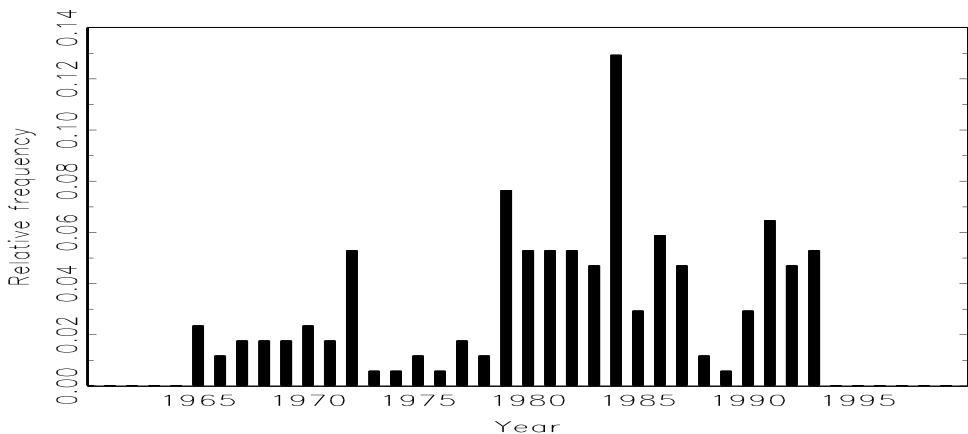

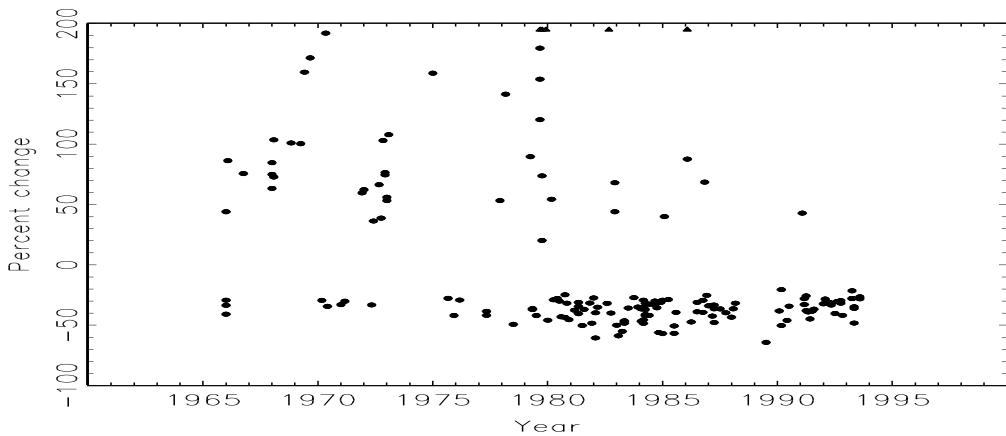

Figure 7: Scatter plots of volatility break dates against percent change in unconditional standard deviation for series for which the SupW statistic is significant at the 5% level, when assuming a single structural change in the unconditional mean. 90% confidence intervals for the break date and the percent change in standard deviation are included. Series for which the standard deviation more than triples are shown as triangles.

(a) Distribution of percent change in unconditional standard deviation

(b) Distribution of break dates

(c) Scatter of break dates against percent change in standard deviation

Figure 8: Characteristics of unconditional volatility breaks for series for which the SupW statistic is significant at the 5% level, when assuming a nonlinear unconditional mean. In panel (a), series for which the standard deviation more than doubles are collected in the right-most category. In panel (c), series for which the standard deviation more than triples are shown as triangles.

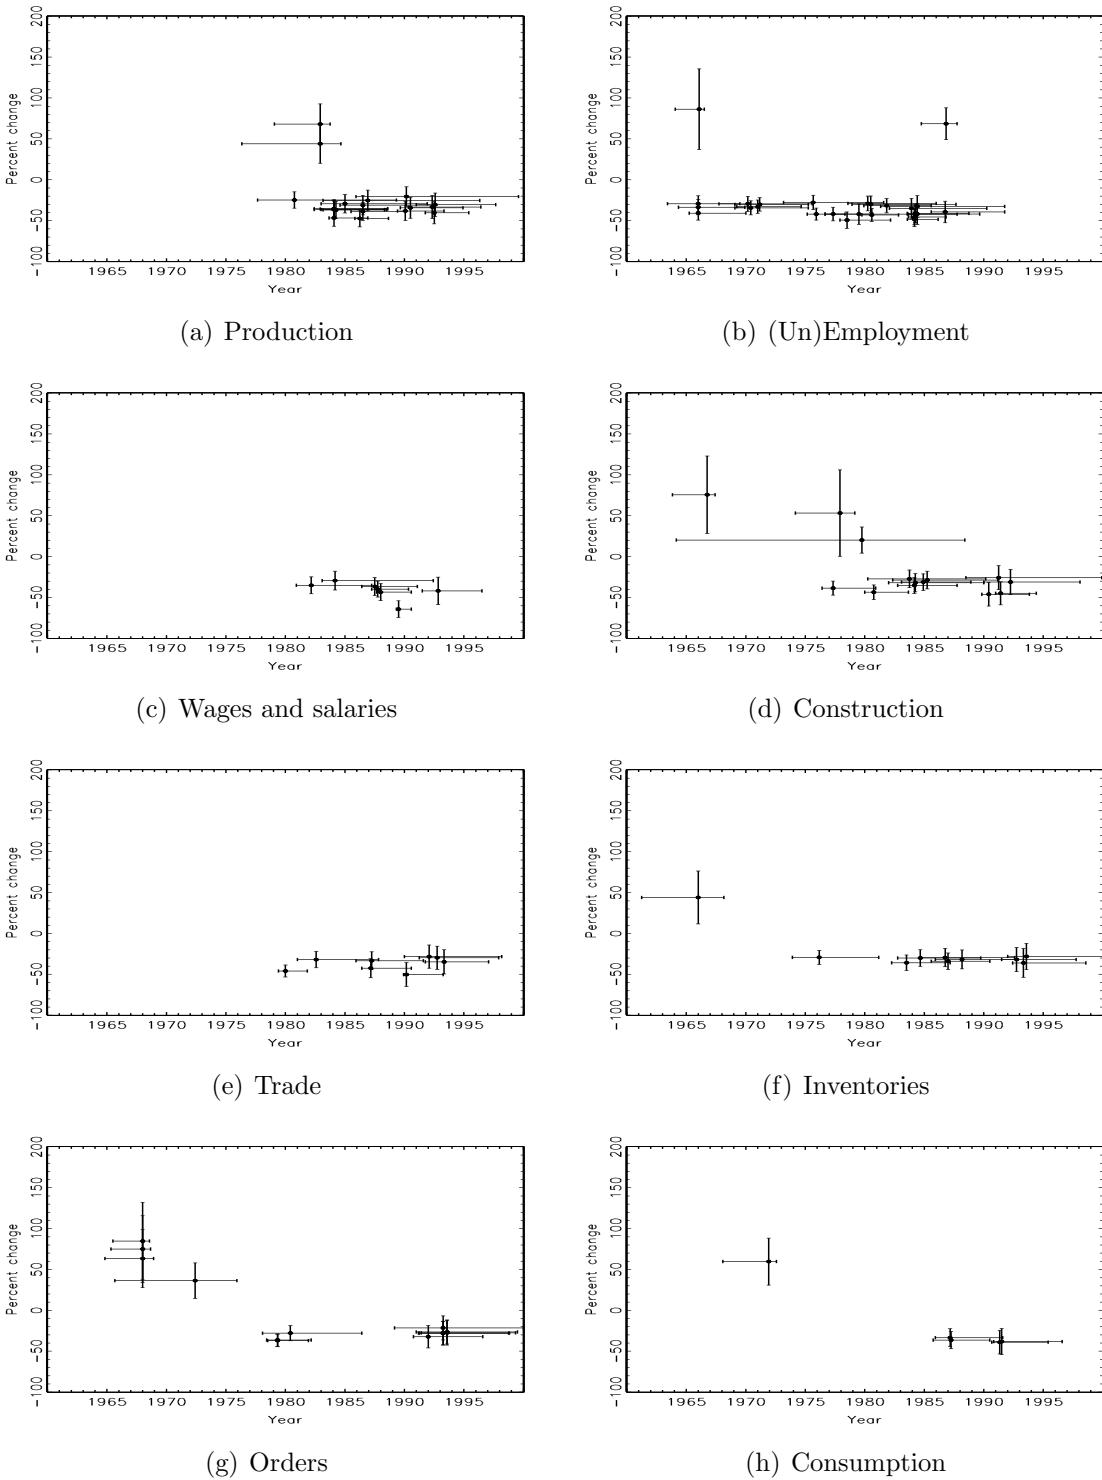

Figure 9: Scatter plots of volatility break dates against percent change in unconditional standard deviation for series for which the SupW statistic is significant at the 5% level, when assuming a nonlinear unconditional mean. 90% confidence intervals for the break date and the percent change in standard deviation are included. Series for which the standard deviation more than triples are shown as triangles.

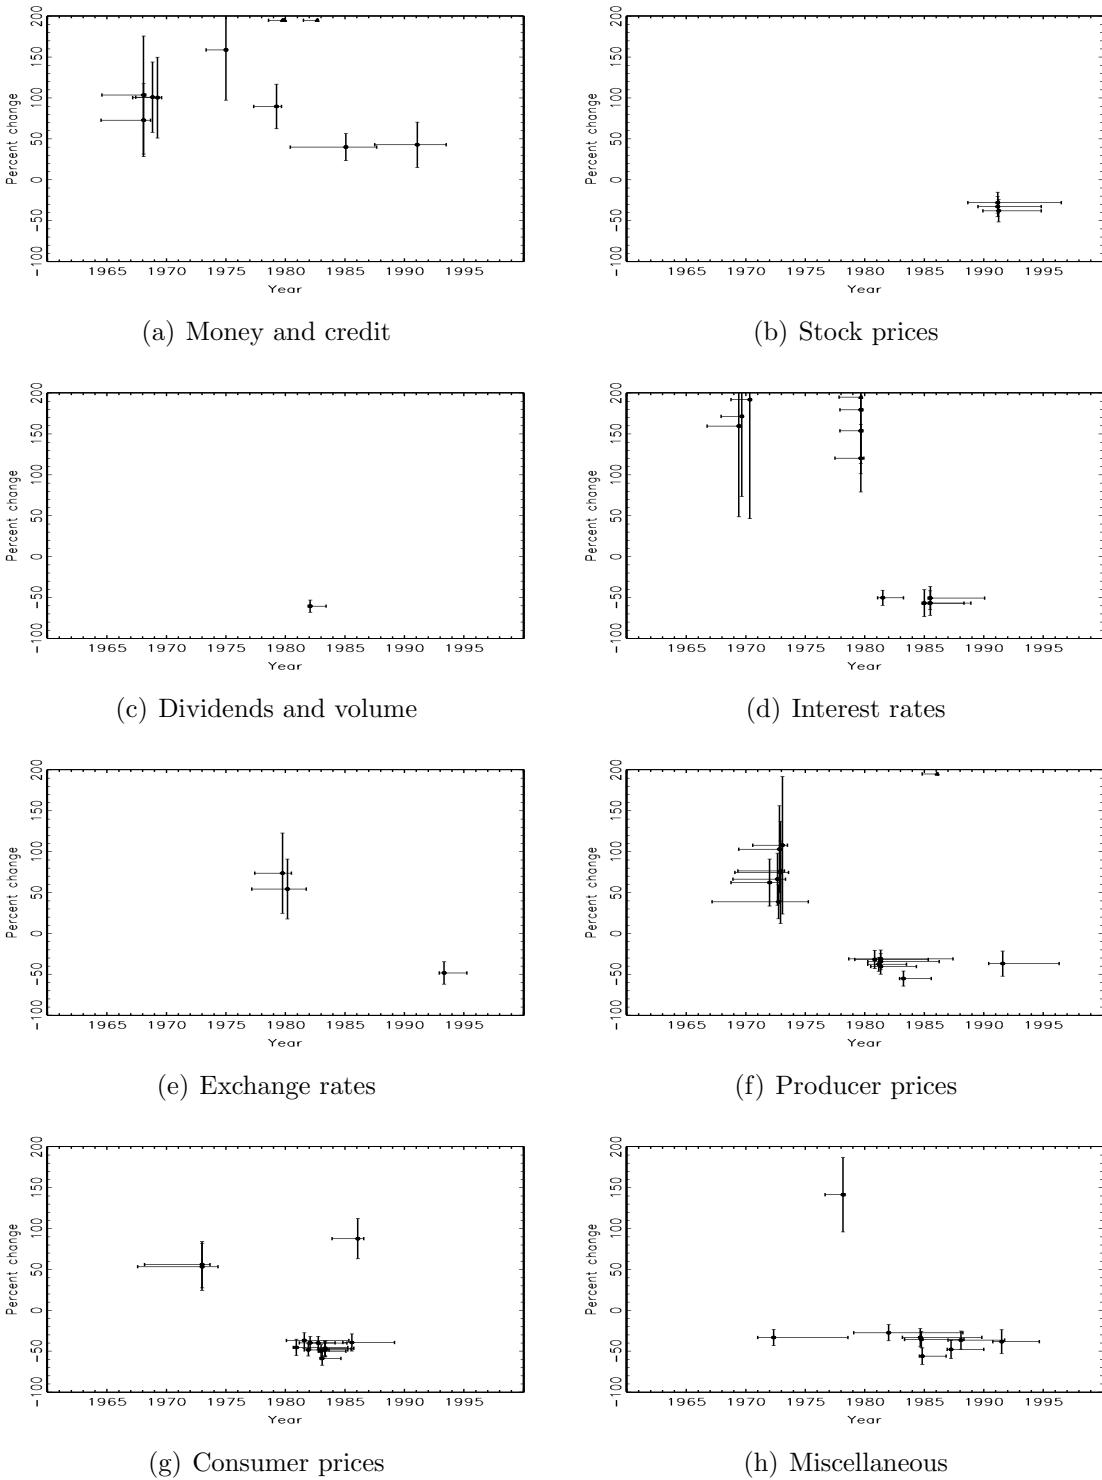

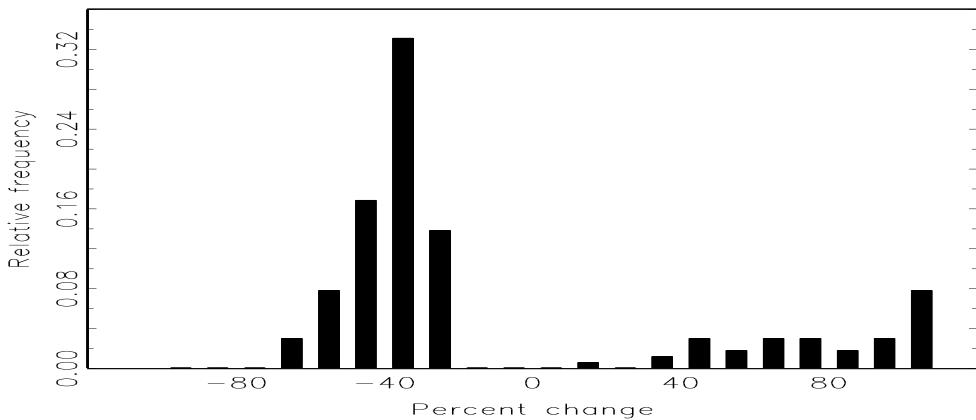

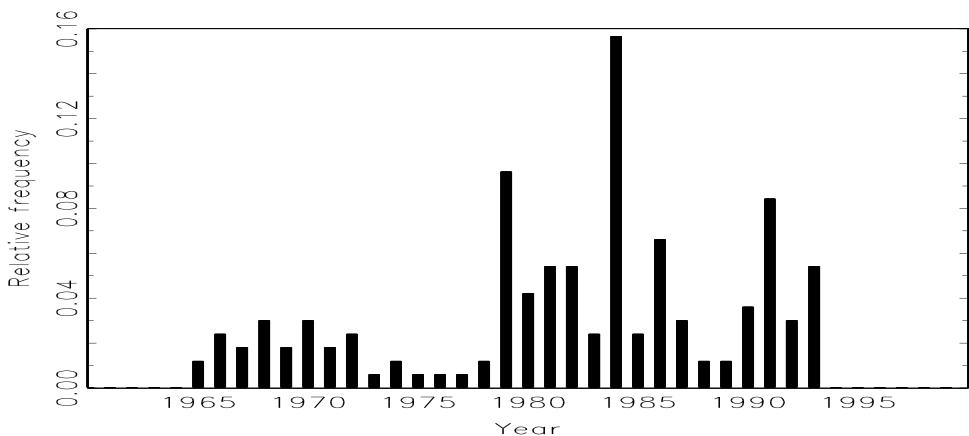

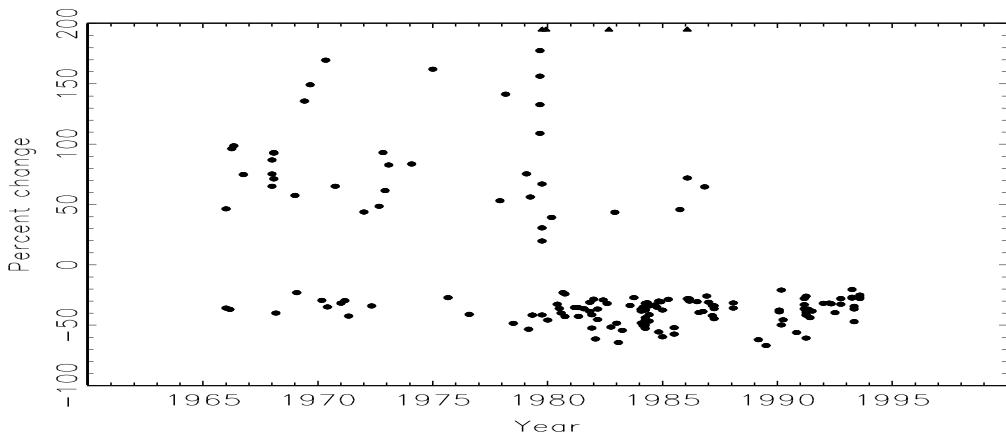

Figure 10: Scatter plots of volatility break dates against percent change in unconditional standard deviation for series for which the SupW statistic is significant at the 5% level, when assuming a nonlinear unconditional mean. 90% confidence intervals for the break date and the percent change in standard deviation are included. Series for which the standard deviation more than triples are shown as triangles.

(a) Distribution of percent change in unconditional standard deviation

(b) Distribution of break dates

(c) Scatter of break dates against percent change in standard deviation

Figure 11: Characteristics of unconditional volatility breaks for series for which the SupW statistic is significant at the 5% level, when assuming a nonlinear unconditional mean with a single structural change during expansions. In panel (a), series for which the standard deviation more than doubles are collected in the right-most category. In panel (c), series for which the standard deviation more than triples are shown as triangles.

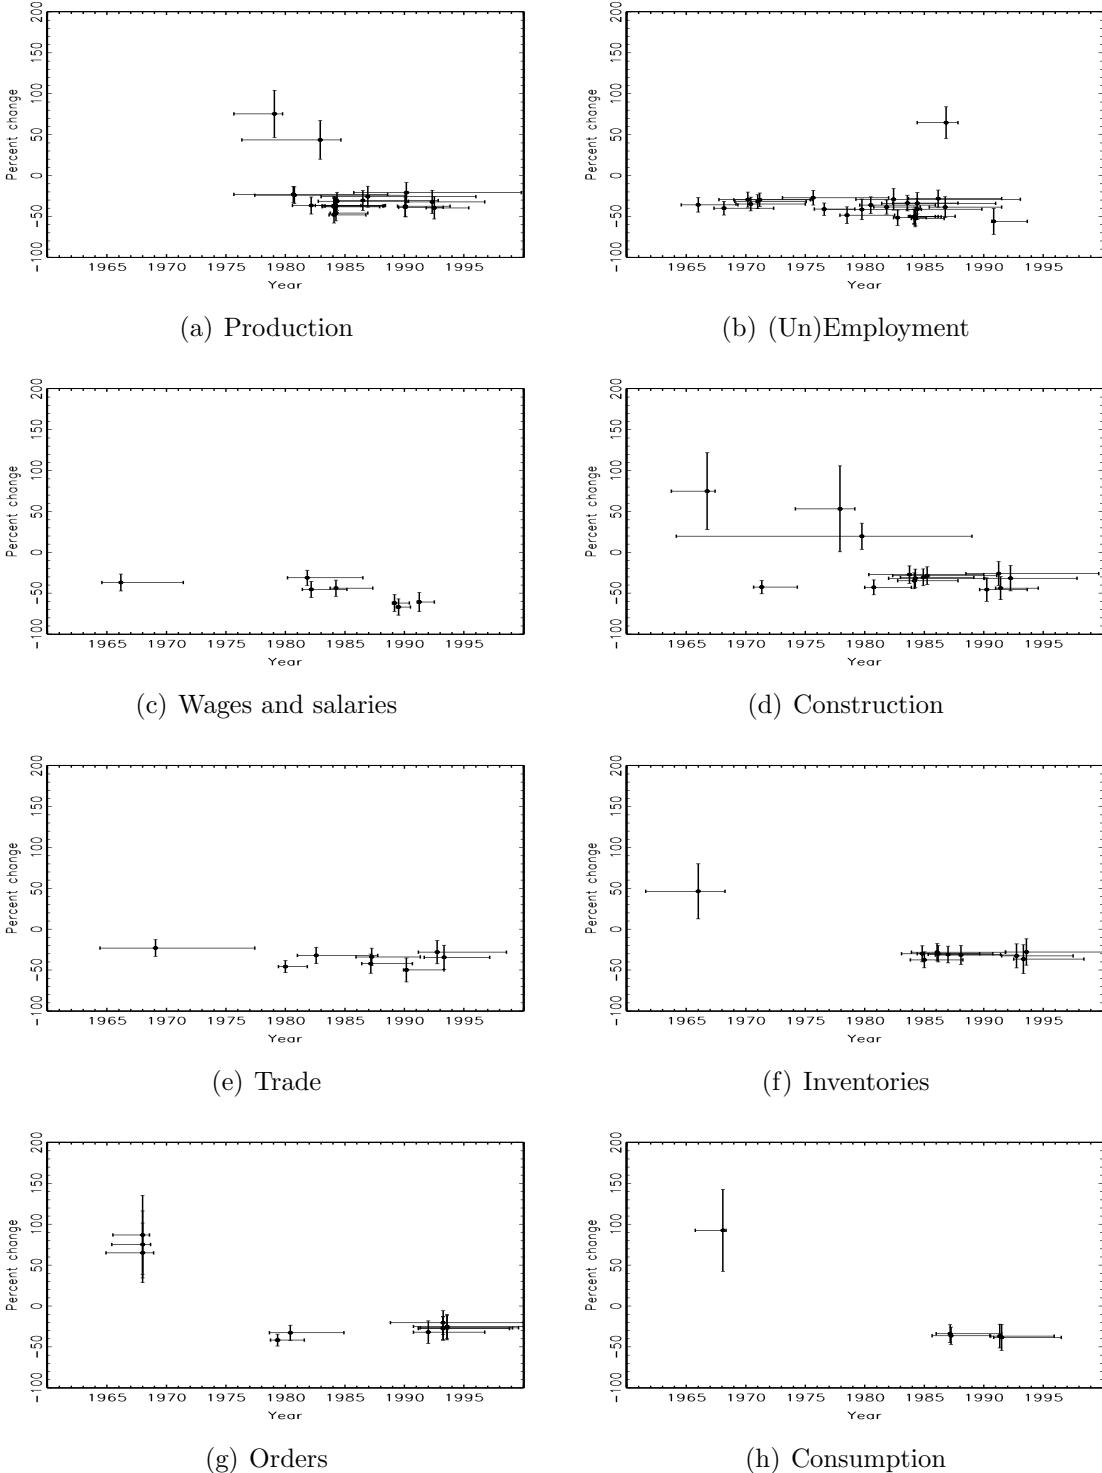

Figure 12: Scatter plots of volatility break dates against percent change in unconditional standard deviation for series for which the SupW statistic is significant at the 5% level, when assuming a nonlinear unconditional mean with a single structural change during expansions. 90% confidence intervals for the break date and the percent change in standard deviation are included. Series for which the standard deviation more than triples are shown as triangles.

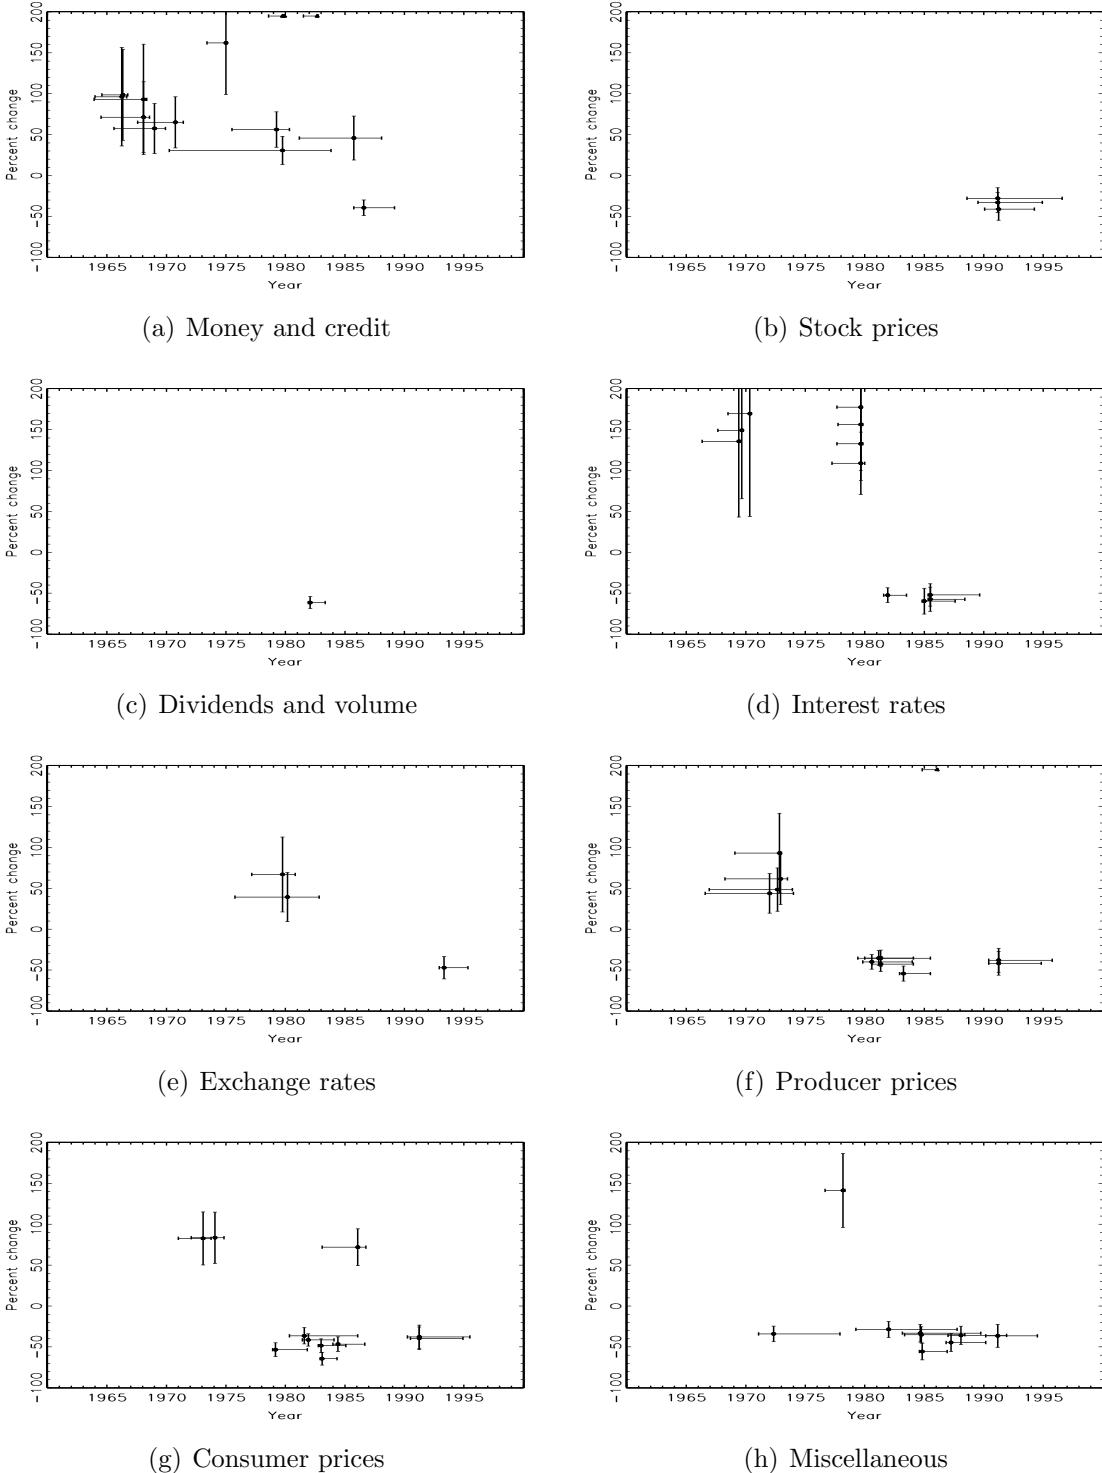

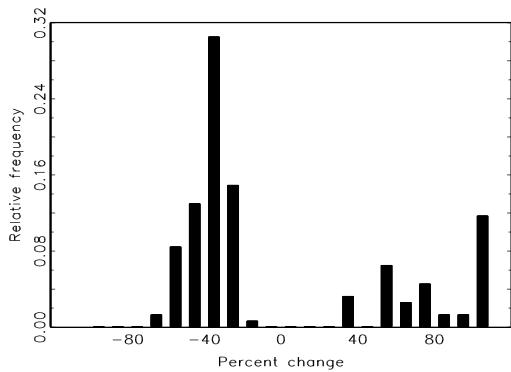

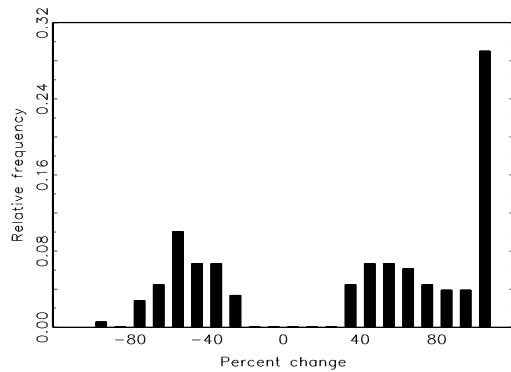

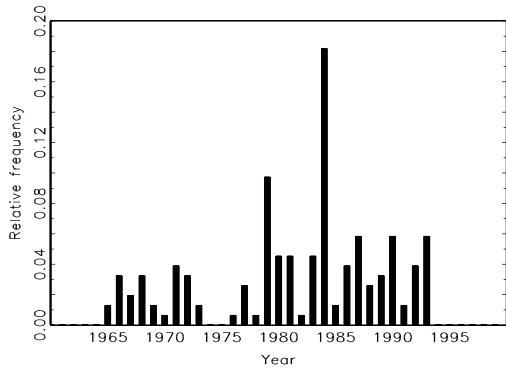

Figure 13: Scatter plots of volatility break dates against percent change in unconditional standard deviation for series for which the SupW statistic is significant at the 5% level, when assuming a nonlinear unconditional mean with a single structural change during expansions. 90% confidence intervals for the break date and the percent change in standard deviation are included. Series for which the standard deviation more than triples are shown as triangles.

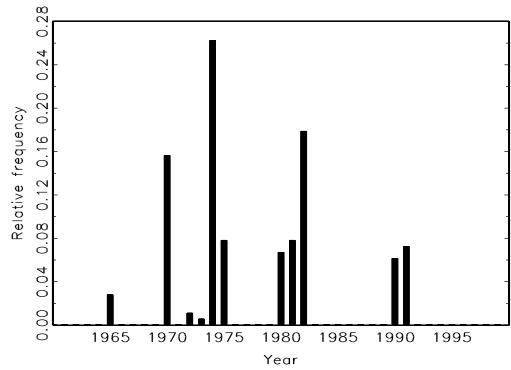

(a) Distribution of percent change in standard deviation during expansions

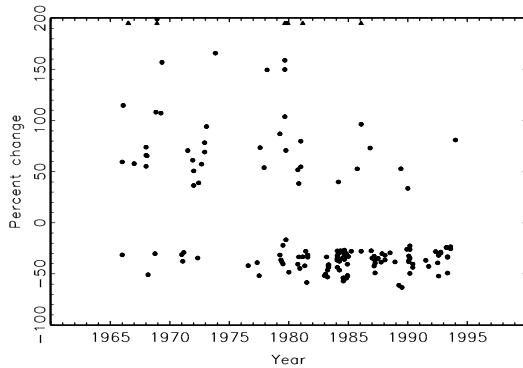

(b) Distribution of percent change in standard deviation during recessions

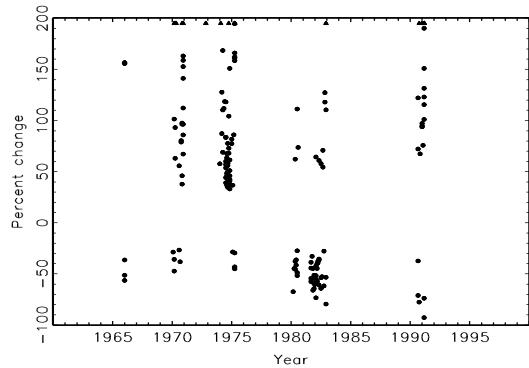

(c) Distribution of break dates for standard deviation during expansions

(d) Distribution of break dates for standard deviation during recessions

(e) Scatter of break dates against percent change in standard deviation during expansions

(f) Scatter of break dates against percent change in standard deviation during recessions

Figure 14: Characteristics of unconditional volatility breaks for series for which the SupW statistics for a structural change in the unconditional volatility in recessions and expansions separately are significant at the 5% level, when assuming a constant unconditional mean. In panels (e) and (f), series for which the standard deviation more than triples are shown as triangles.

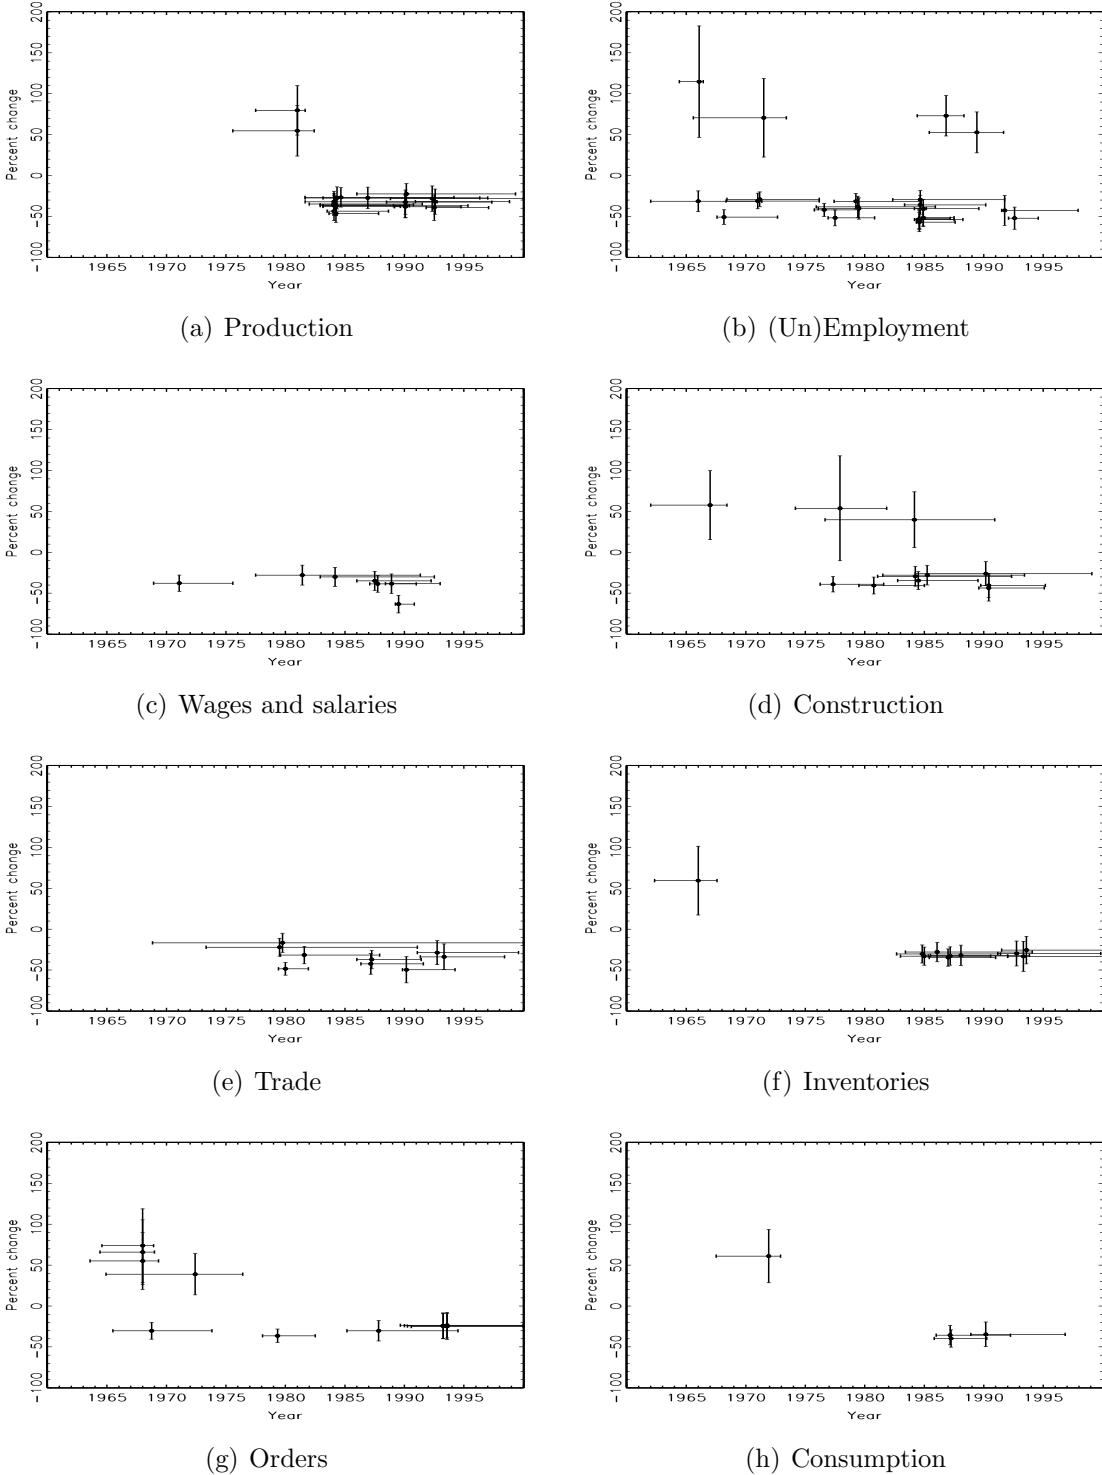

Figure 15: Scatter plots of volatility break dates against percent change in unconditional standard deviation during expansions for series for which the SupW statistic for a structural change in the unconditional volatility in expansions only is significant at the 5% level, when assuming a constant unconditional mean. 90% confidence intervals for the break date and the percent change in standard deviation are included. Series for which the standard deviation more than triples are shown as triangles.

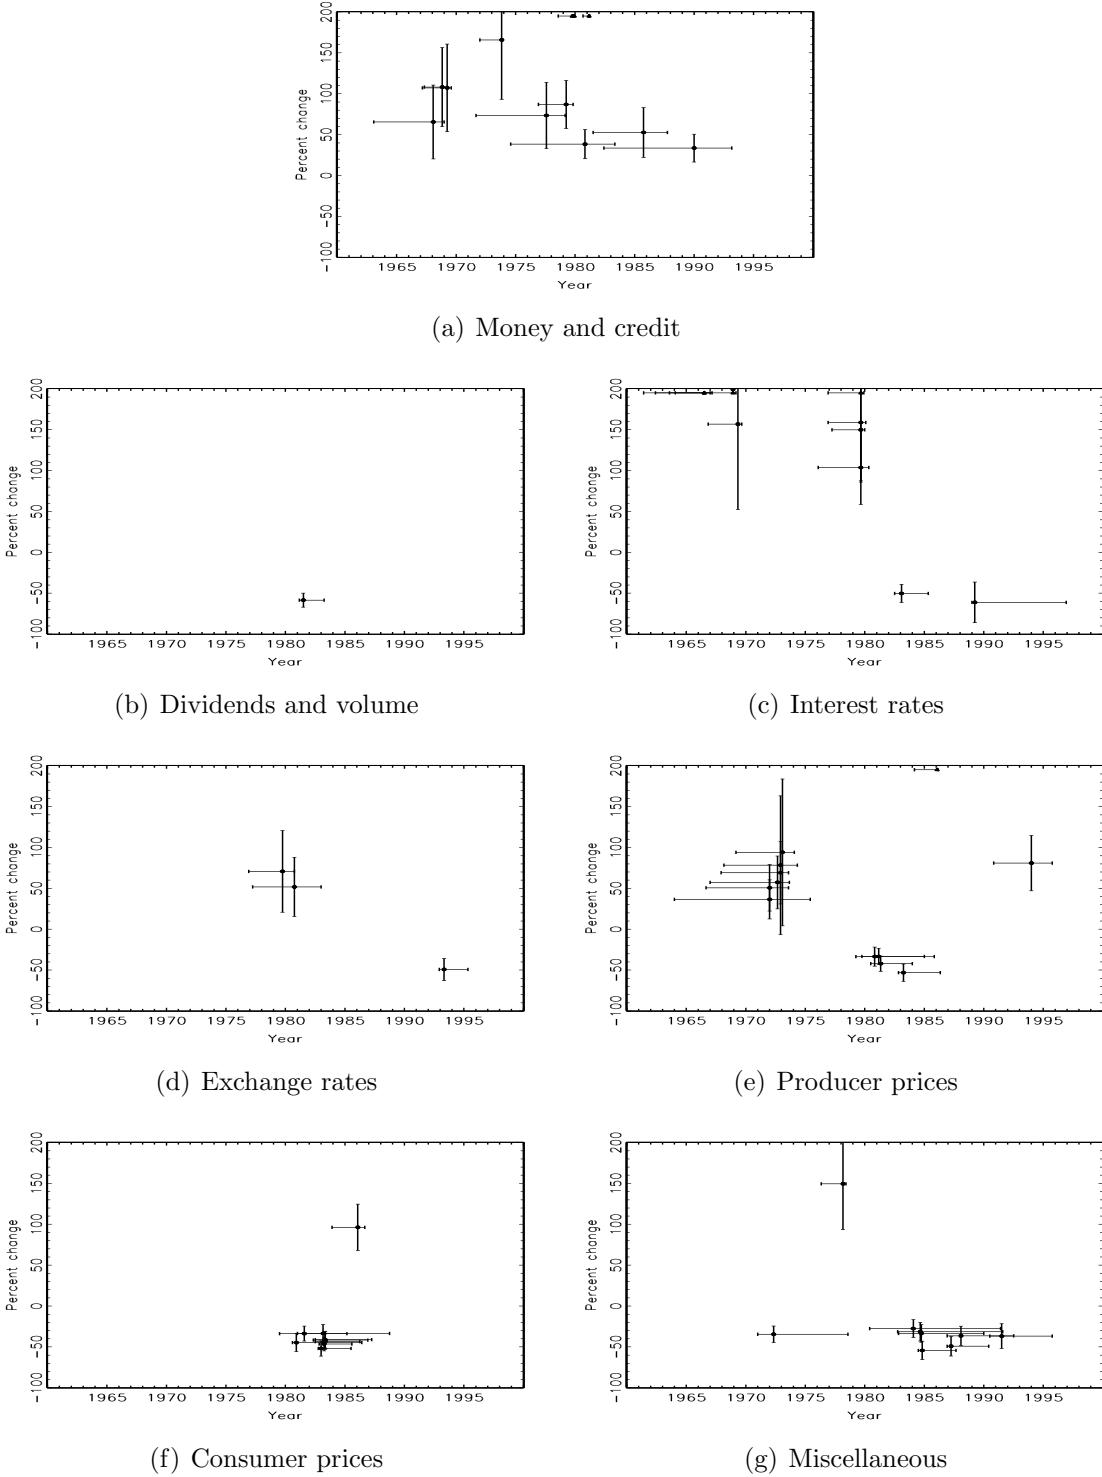

Figure 16: Scatter plots of volatility break dates against percent change in unconditional standard deviation during expansions for series for which the SupW statistic for a structural change in the unconditional volatility in expansions only is significant at the 5% level, when assuming a constant unconditional mean. 90% confidence intervals for the break date and the percent change in standard deviation are included. Series for which the standard deviation more than triples are shown as triangles.

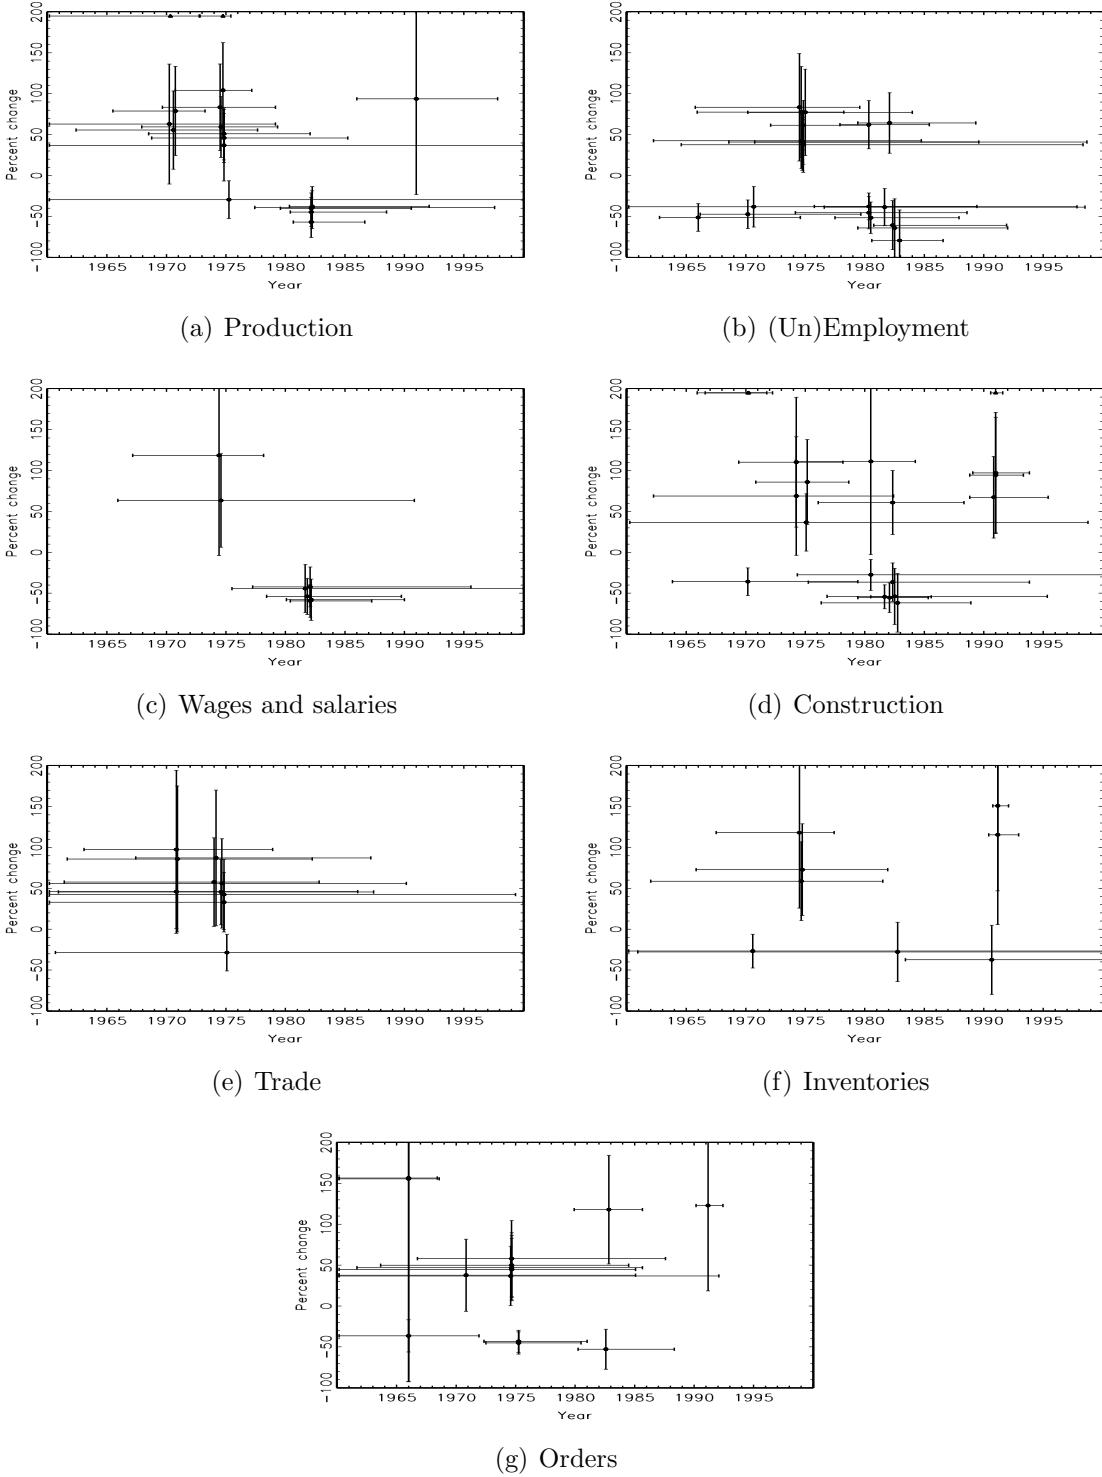

Figure 17: Scatter plots of volatility break dates against percent change in unconditional standard deviation during recessions for series for which the SupW statistic for a structural change in the unconditional volatility in expansions only is significant at the 5% level, when assuming a constant unconditional mean. 90% confidence intervals for the break date and the percent change in standard deviation are included. Series for which the standard deviation more than triples are shown as triangles.

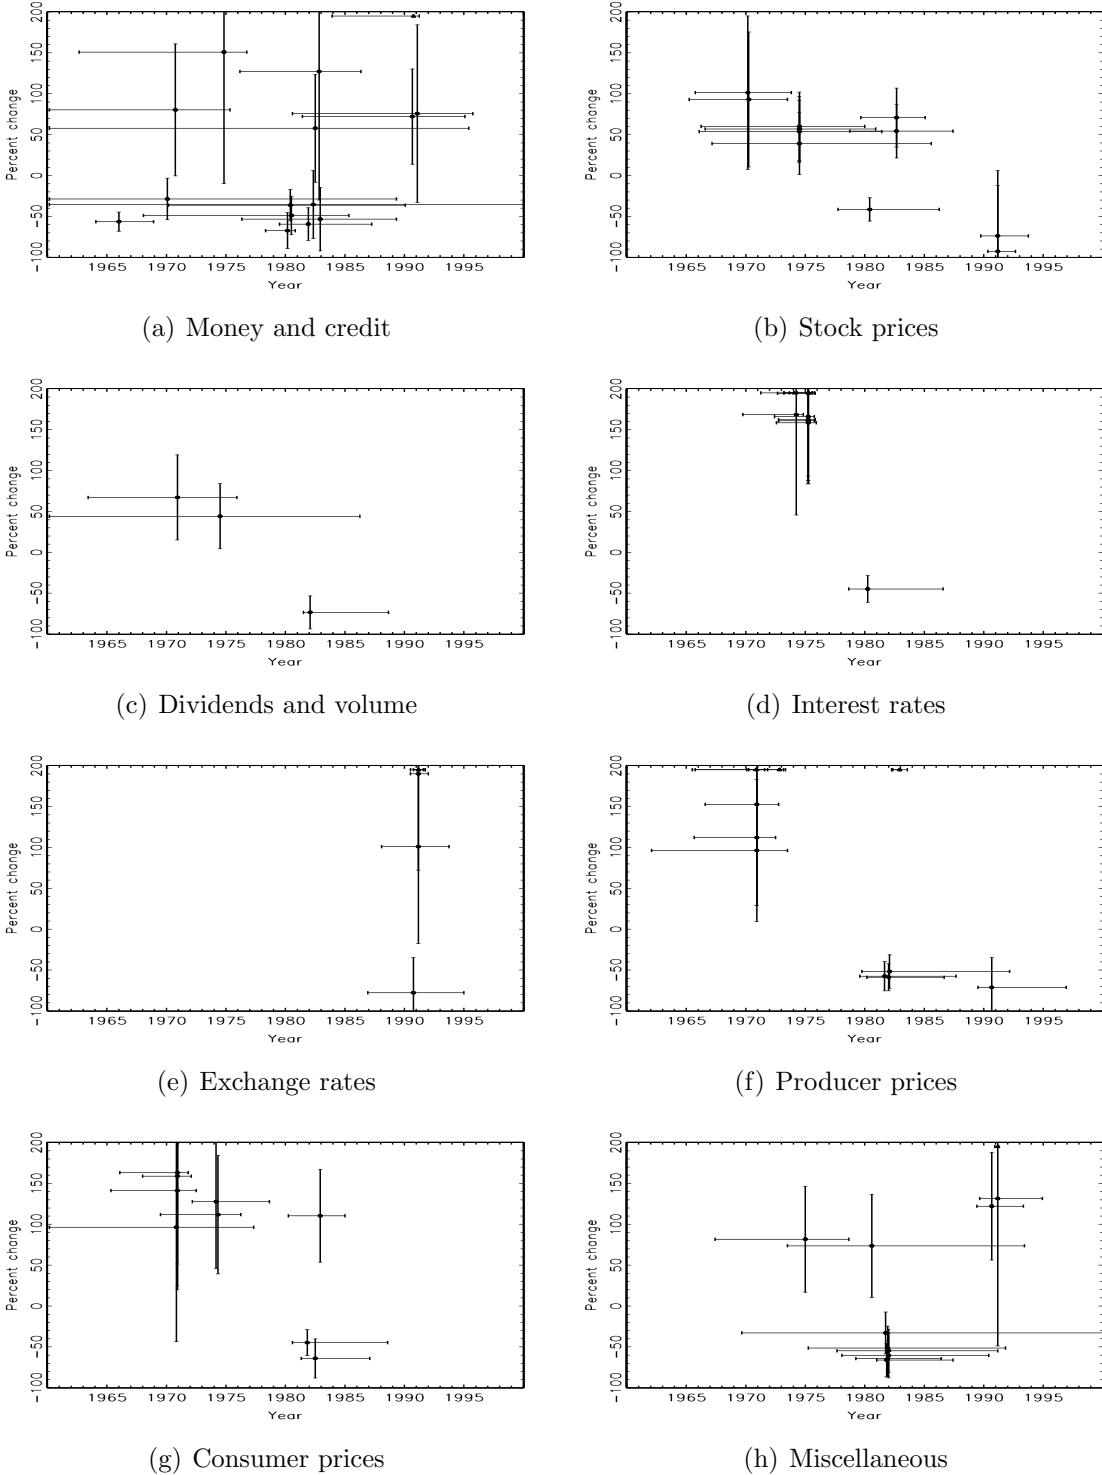

Figure 18: Scatter plots of volatility break dates against percent change in unconditional standard deviation during recessions for series for which the SupW statistic for a structural change in the unconditional volatility in expansions only is significant at the 5% level, when assuming a constant unconditional mean. 90% confidence intervals for the break date and the percent change in standard deviation are included. Series for which the standard deviation more than triples are shown as triangles.

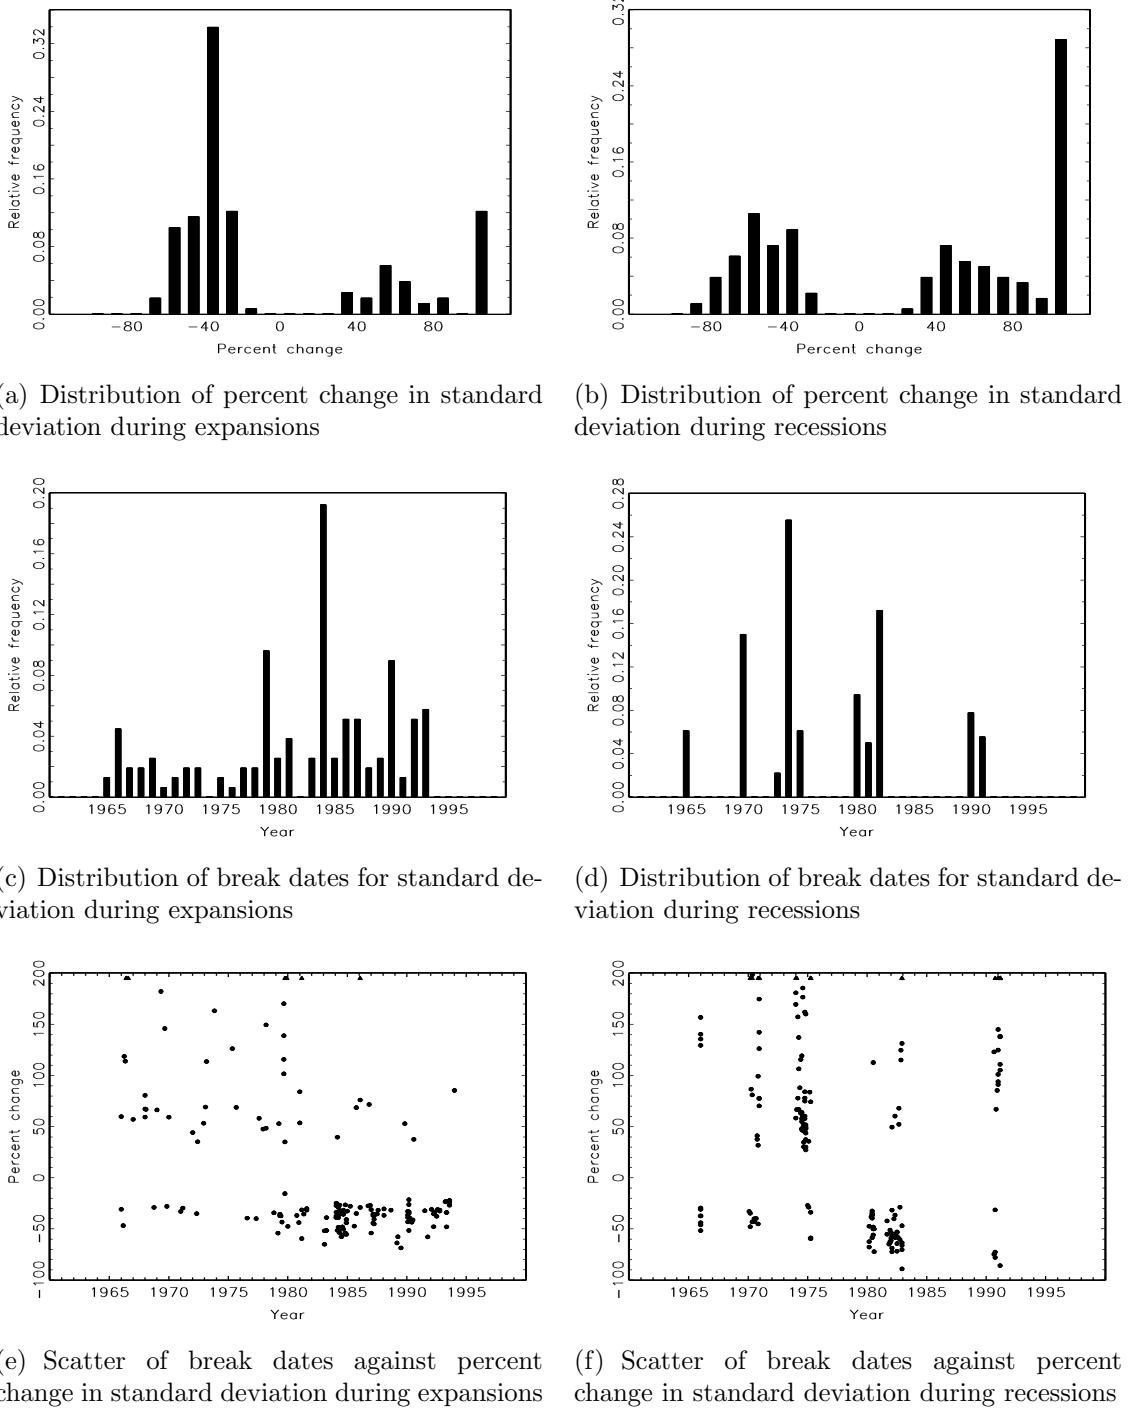

Figure 19: Characteristics of unconditional volatility breaks for series for which the SupW statistics for a structural change in the unconditional volatility in recessions and expansions separately are significant at the 5% level, when assuming a single structural change in the unconditional mean. In panels (e) and (f), series for which the standard deviation more than triples are shown as triangles.

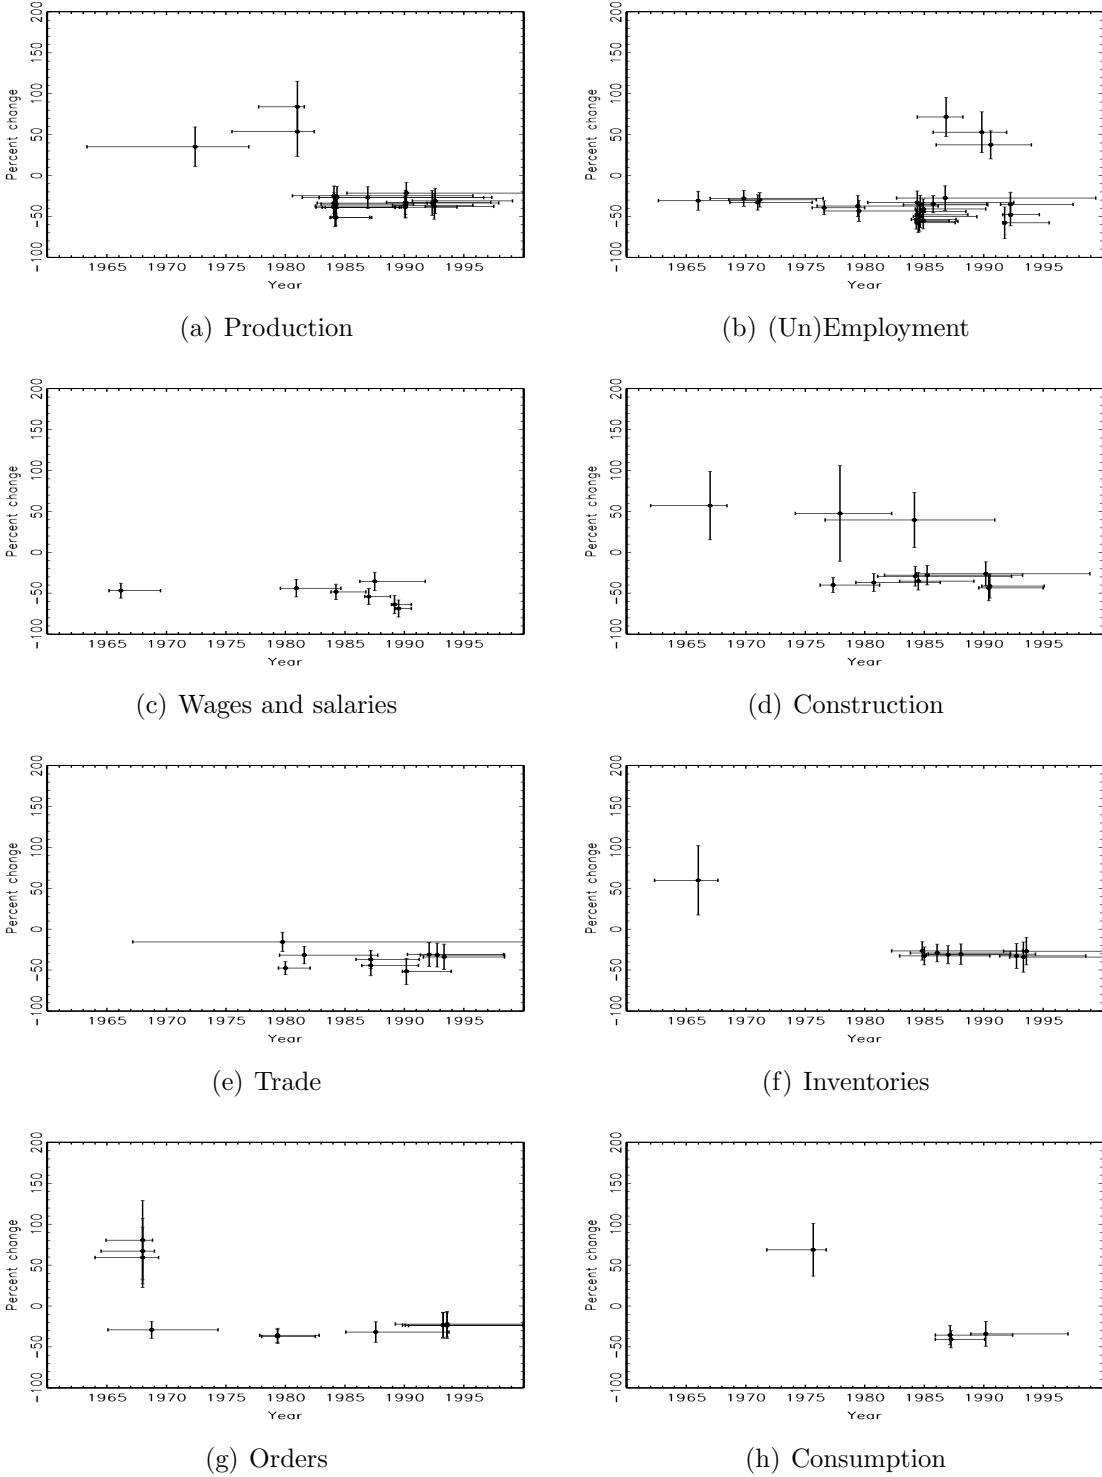

Figure 20: Scatter plots of volatility break dates against percent change in unconditional standard deviation during expansions for series for which the SupW statistic for a structural change in the unconditional volatility in expansions only is significant at the 5% level, when assuming a single structural change in the unconditional mean. 90% confidence intervals for the break date and the percent change in standard deviation are included. Series for which the standard deviation more than triples are shown as triangles.

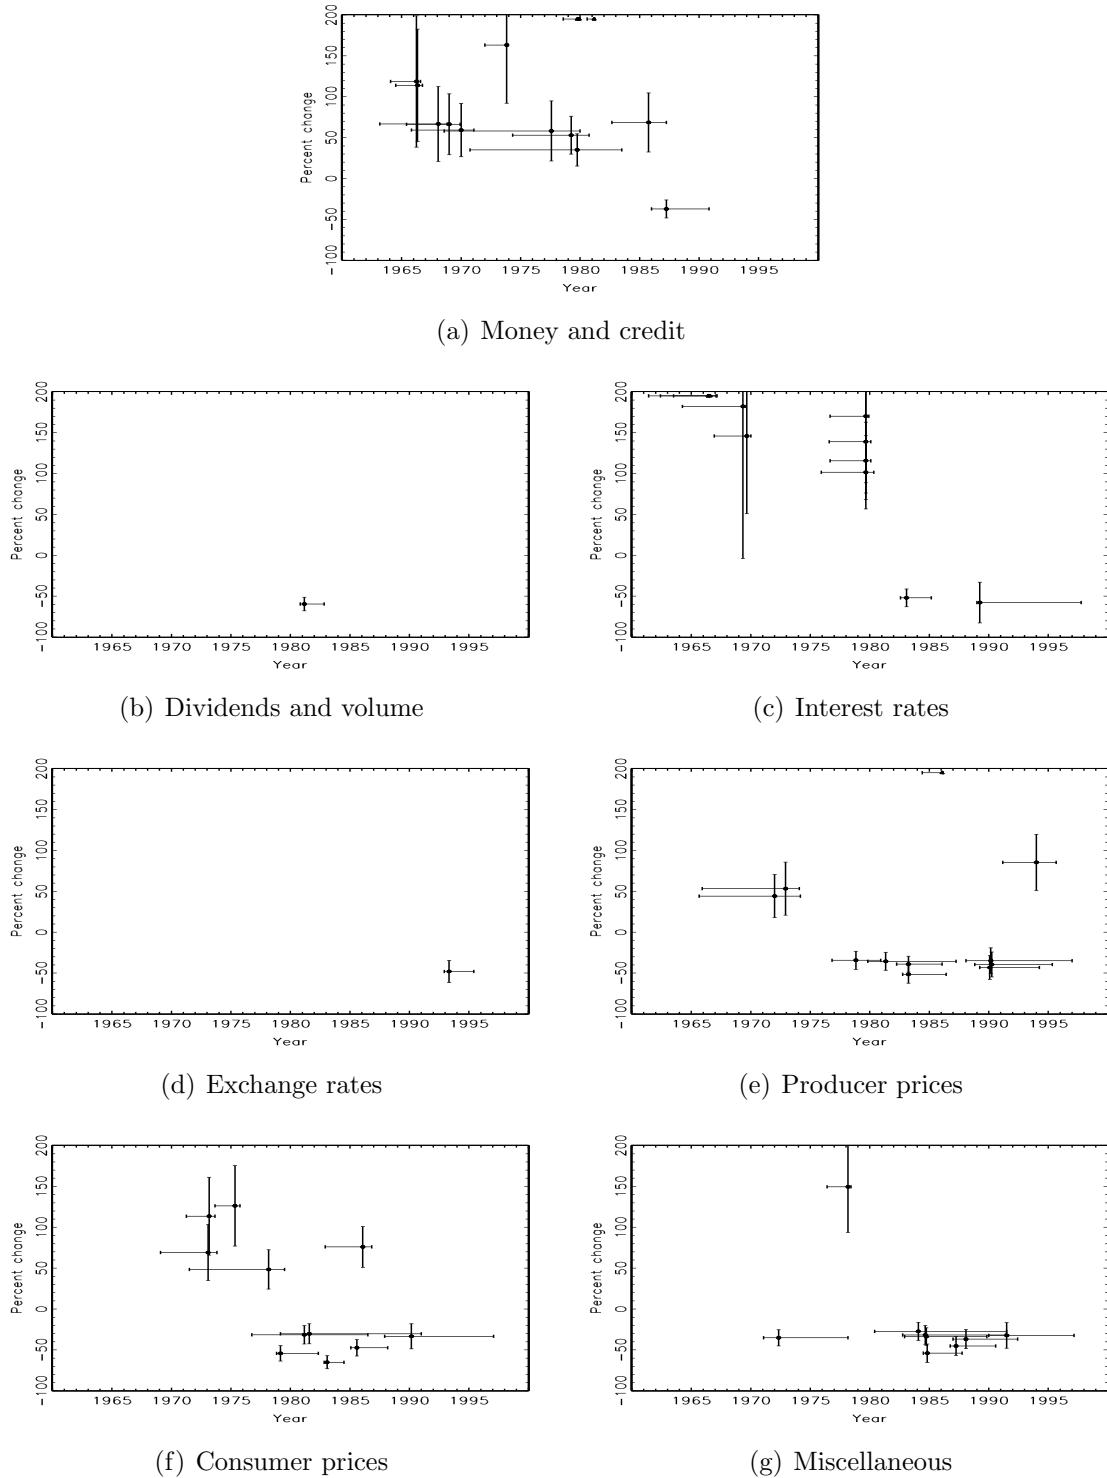

Figure 21: Scatter plots of volatility break dates against percent change in unconditional standard deviation during expansions for series for which the SupW statistic for a structural change in the unconditional volatility in expansions only is significant at the 5% level, when assuming a single structural change in the unconditional mean. 90% confidence intervals for the break date and the percent change in standard deviation are included. Series for which the standard deviation more than triples are shown as triangles.

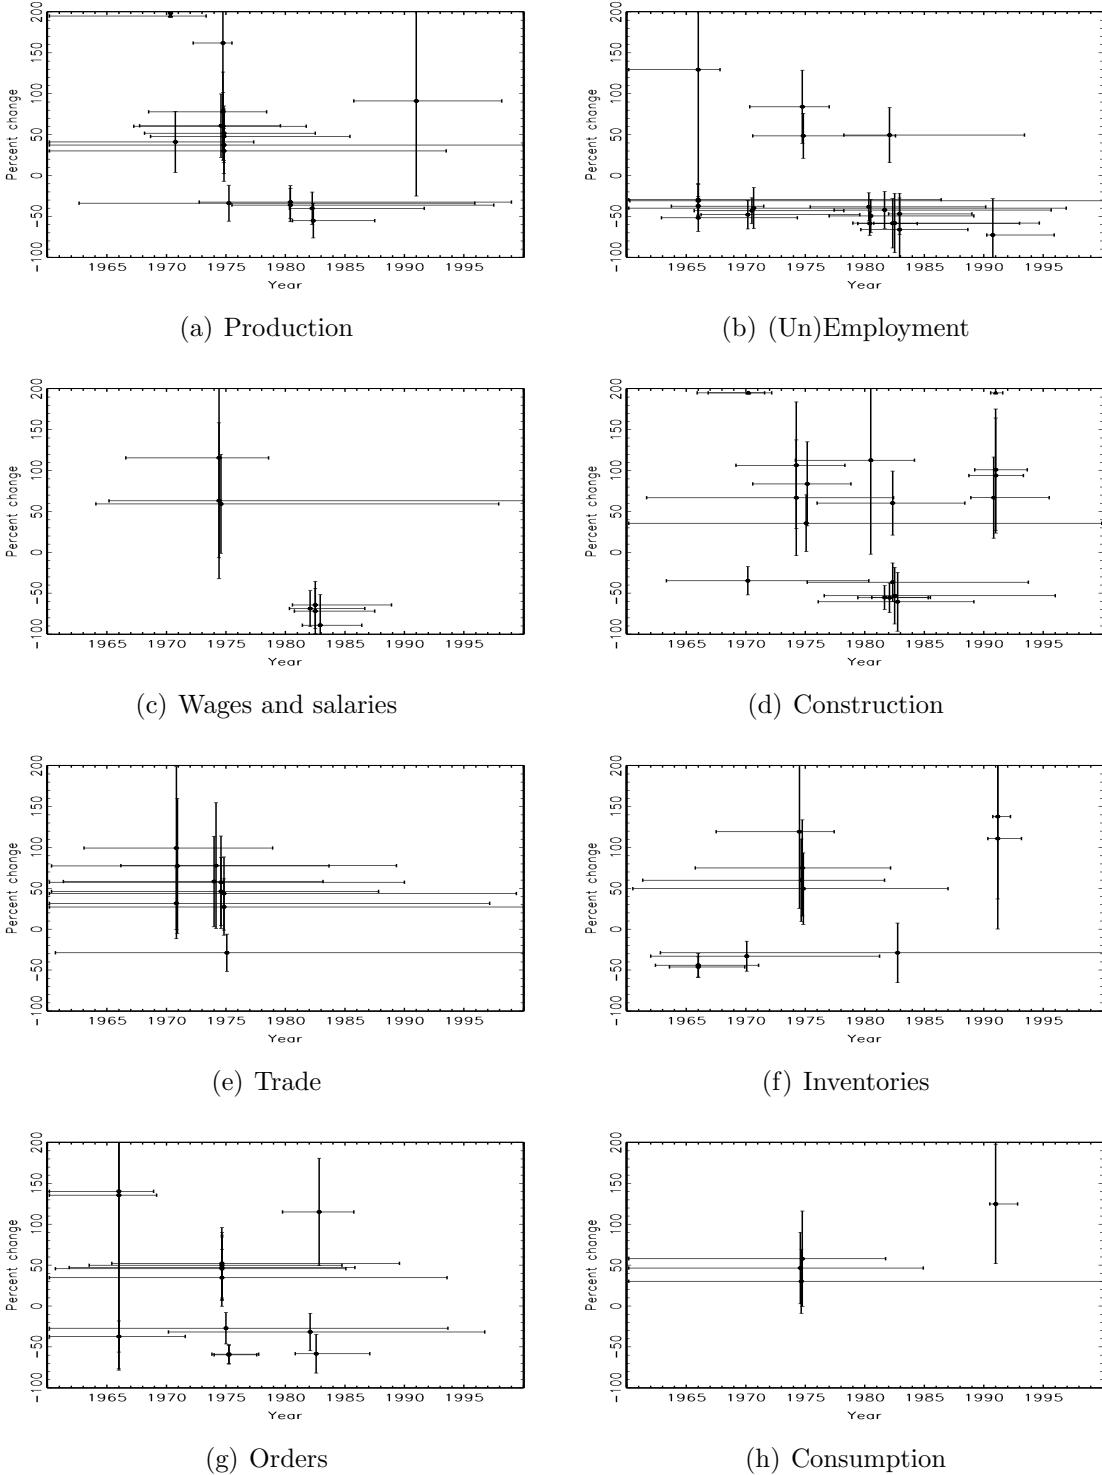

Figure 22: Scatter plots of volatility break dates against percent change in unconditional standard deviation during recessions for series for which the SupW statistic for a structural change in the unconditional volatility in expansions only is significant at the 5% level, when assuming a single structural change in the unconditional mean. 90% confidence intervals for the break date and the percent change in standard deviation are included. Series for which the standard deviation more than triples are shown as triangles.

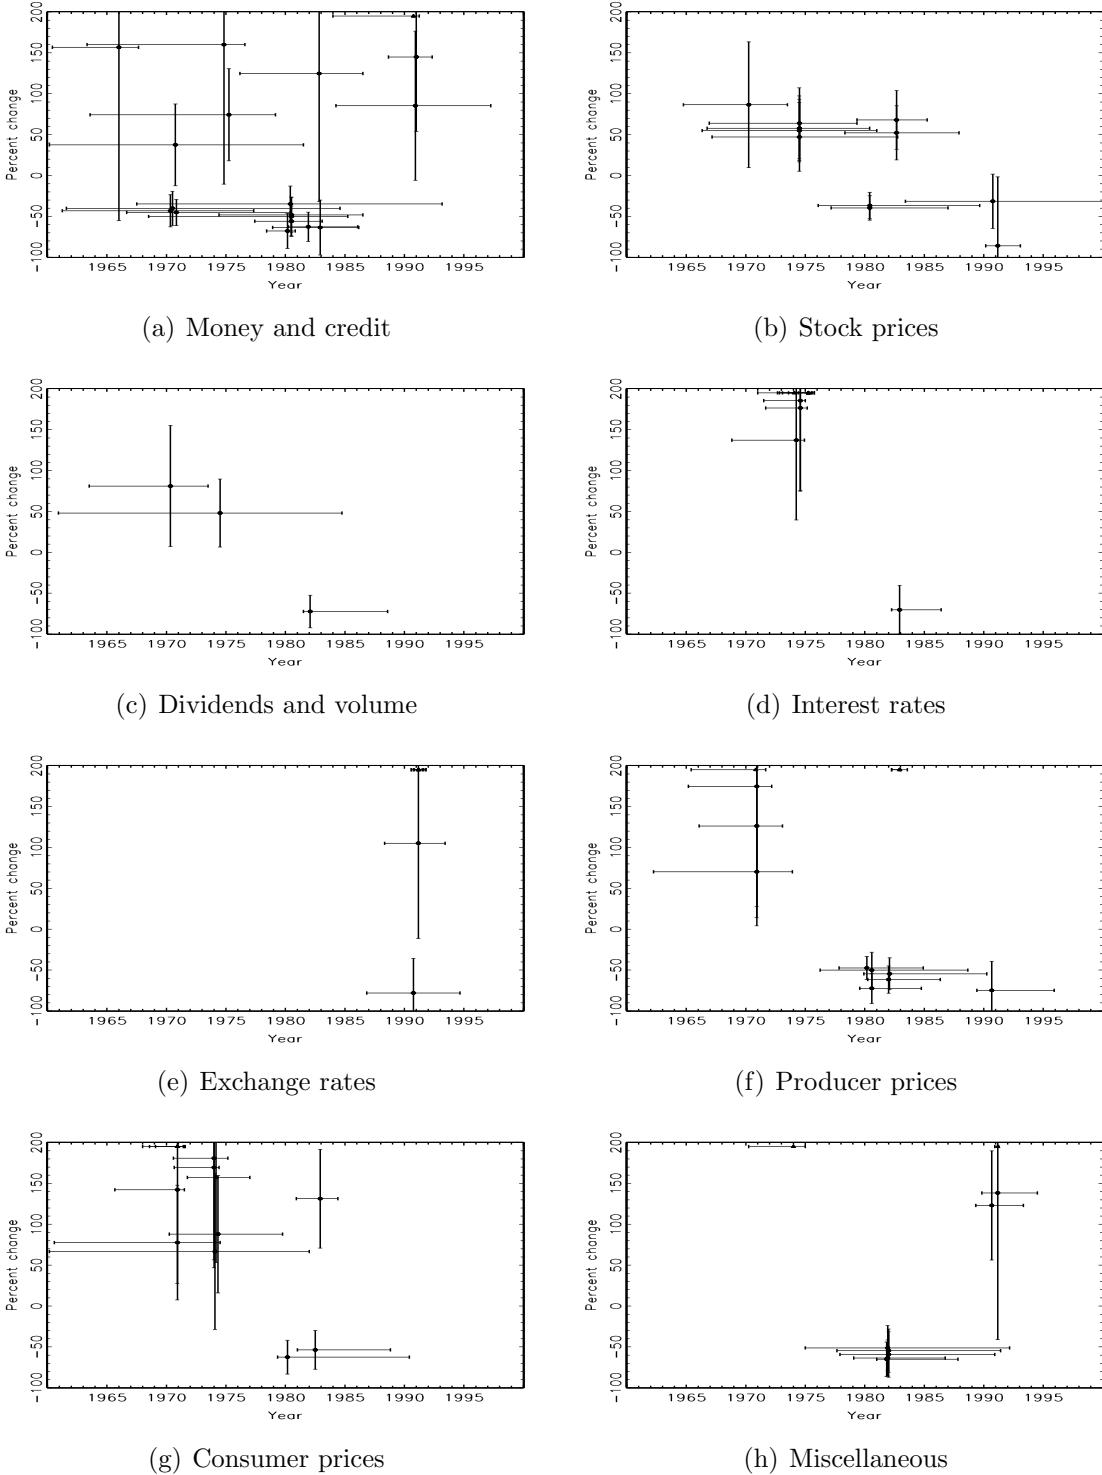

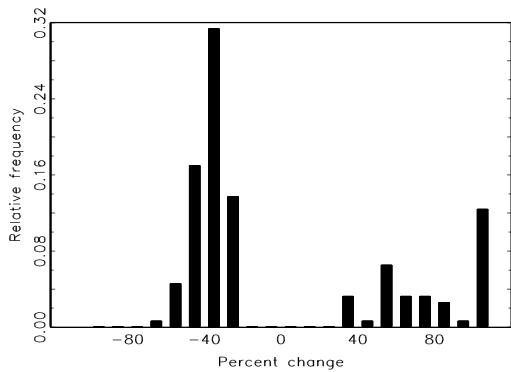

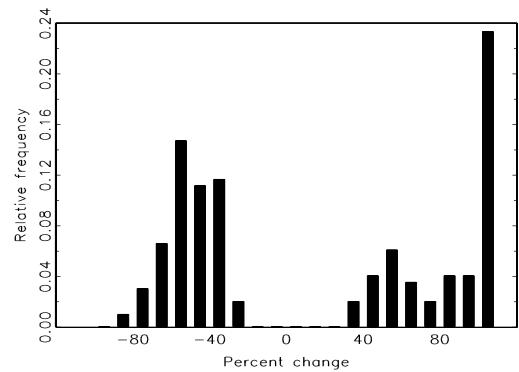

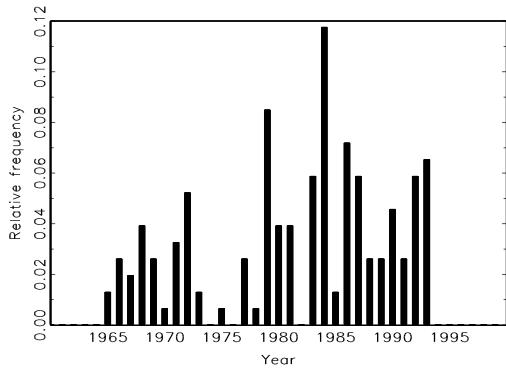

Figure 23: Scatter plots of volatility break dates against percent change in unconditional standard deviation during recessions for series for which the SupW statistic for a structural change in the unconditional volatility in expansions only is significant at the 5% level, when assuming a single structural change in the unconditional mean. 90% confidence intervals for the break date and the percent change in standard deviation are included. Series for which the standard deviation more than triples are shown as triangles.

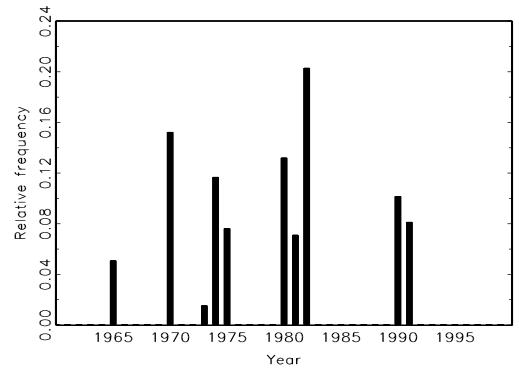

(a) Distribution of percent change in standard deviation during expansions

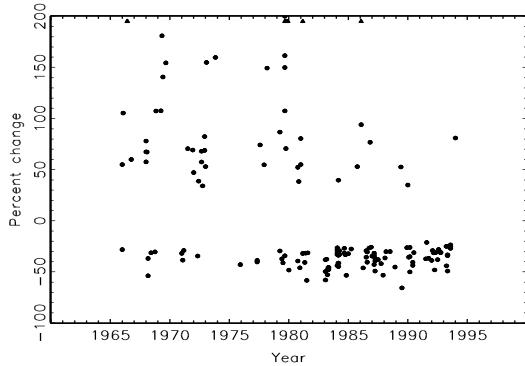

(b) Distribution of percent change in standard deviation during recessions

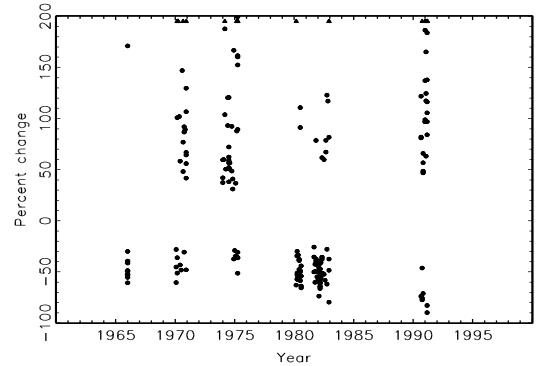

(c) Distribution of break dates for standard deviation during expansions

(d) Distribution of break dates for standard deviation during recessions

(e) Scatter of break dates against percent change in standard deviation during expansions

(f) Scatter of break dates against percent change in standard deviation during recessions

Figure 24: Characteristics of unconditional volatility breaks for series for which the SupW statistics for a structural change in the unconditional volatility in recessions and expansions separately are significant at the 5% level, when assuming a nonlinear unconditional mean. In panels (e) and (f), series for which the standard deviation more than triples are shown as triangles.

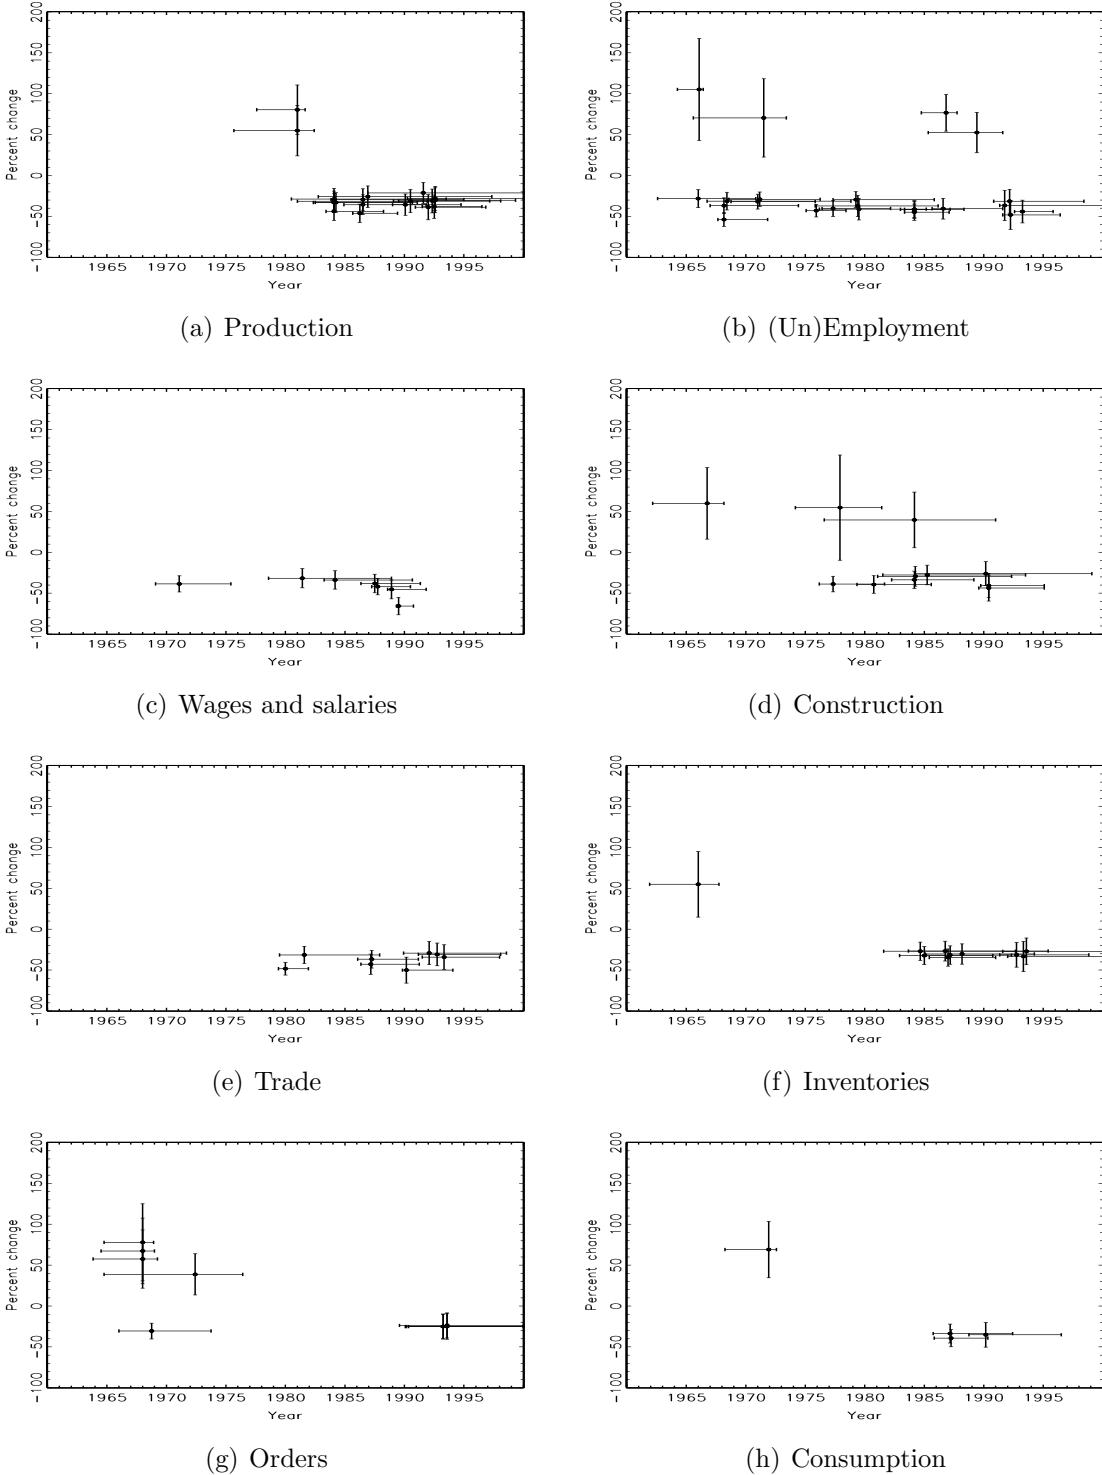

Figure 25: Scatter plots of volatility break dates against percent change in unconditional standard deviation during expansions for series for which the SupW statistic for a structural change in the unconditional volatility in expansions only is significant at the 5% level, when assuming a nonlinear unconditional mean. 90% confidence intervals for the break date and the percent change in standard deviation are included. Series for which the standard deviation more than triples are shown as triangles.

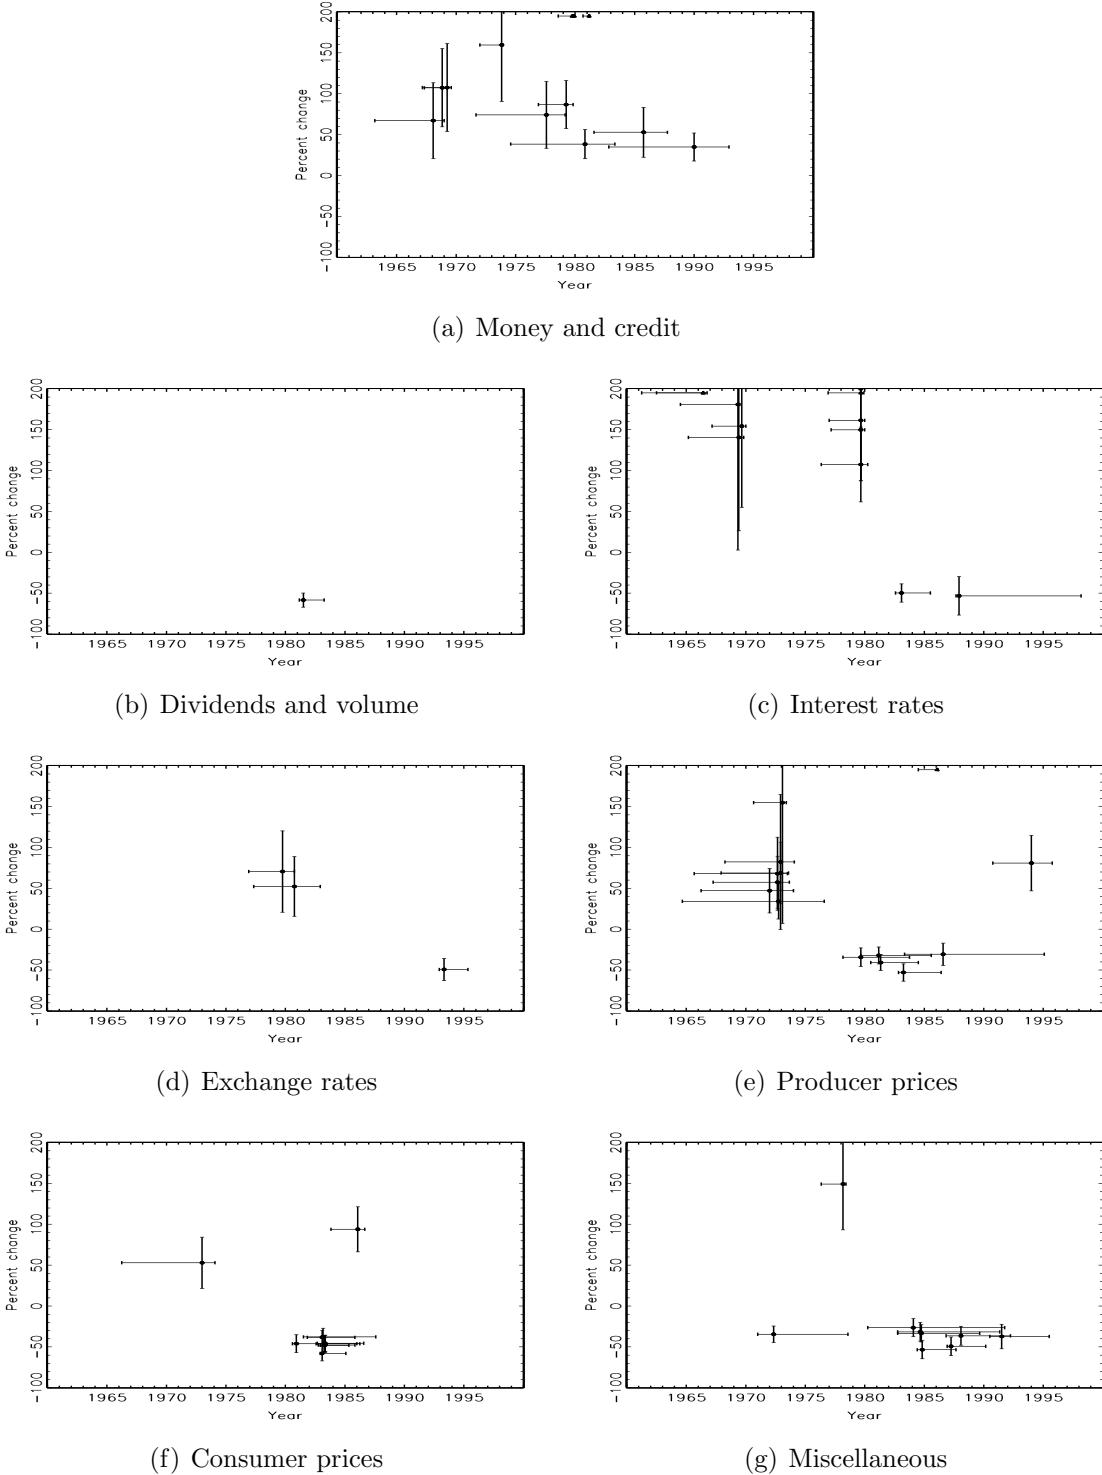

Figure 26: Scatter plots of volatility break dates against percent change in unconditional standard deviation during expansions for series for which the SupW statistic for a structural change in the unconditional volatility in expansions only is significant at the 5% level, when assuming a nonlinear unconditional mean. 90% confidence intervals for the break date and the percent change in standard deviation are included. Series for which the standard deviation more than triples are shown as triangles.

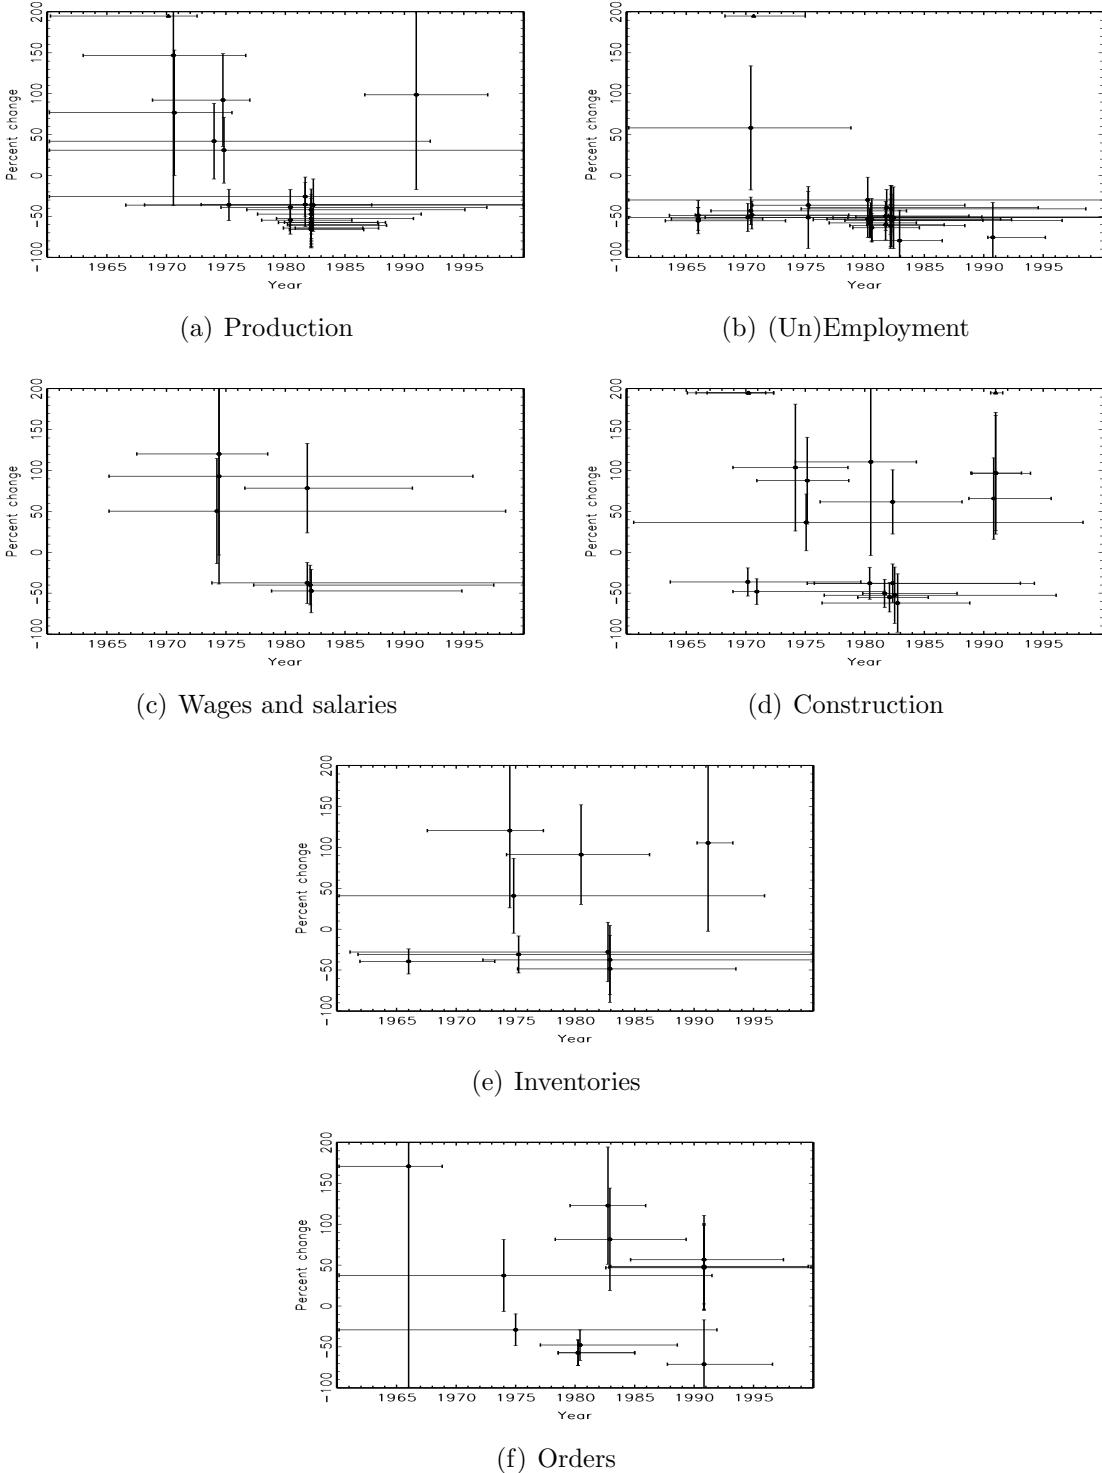

Figure 27: Scatter plots of volatility break dates against percent change in unconditional standard deviation during recessions for series for which the SupW statistic for a structural change in the unconditional volatility in expansions only is significant at the 5% level, when assuming a nonlinear unconditional mean. 90% confidence intervals for the break date and the percent change in standard deviation are included. Series for which the standard deviation more than triples are shown as triangles.

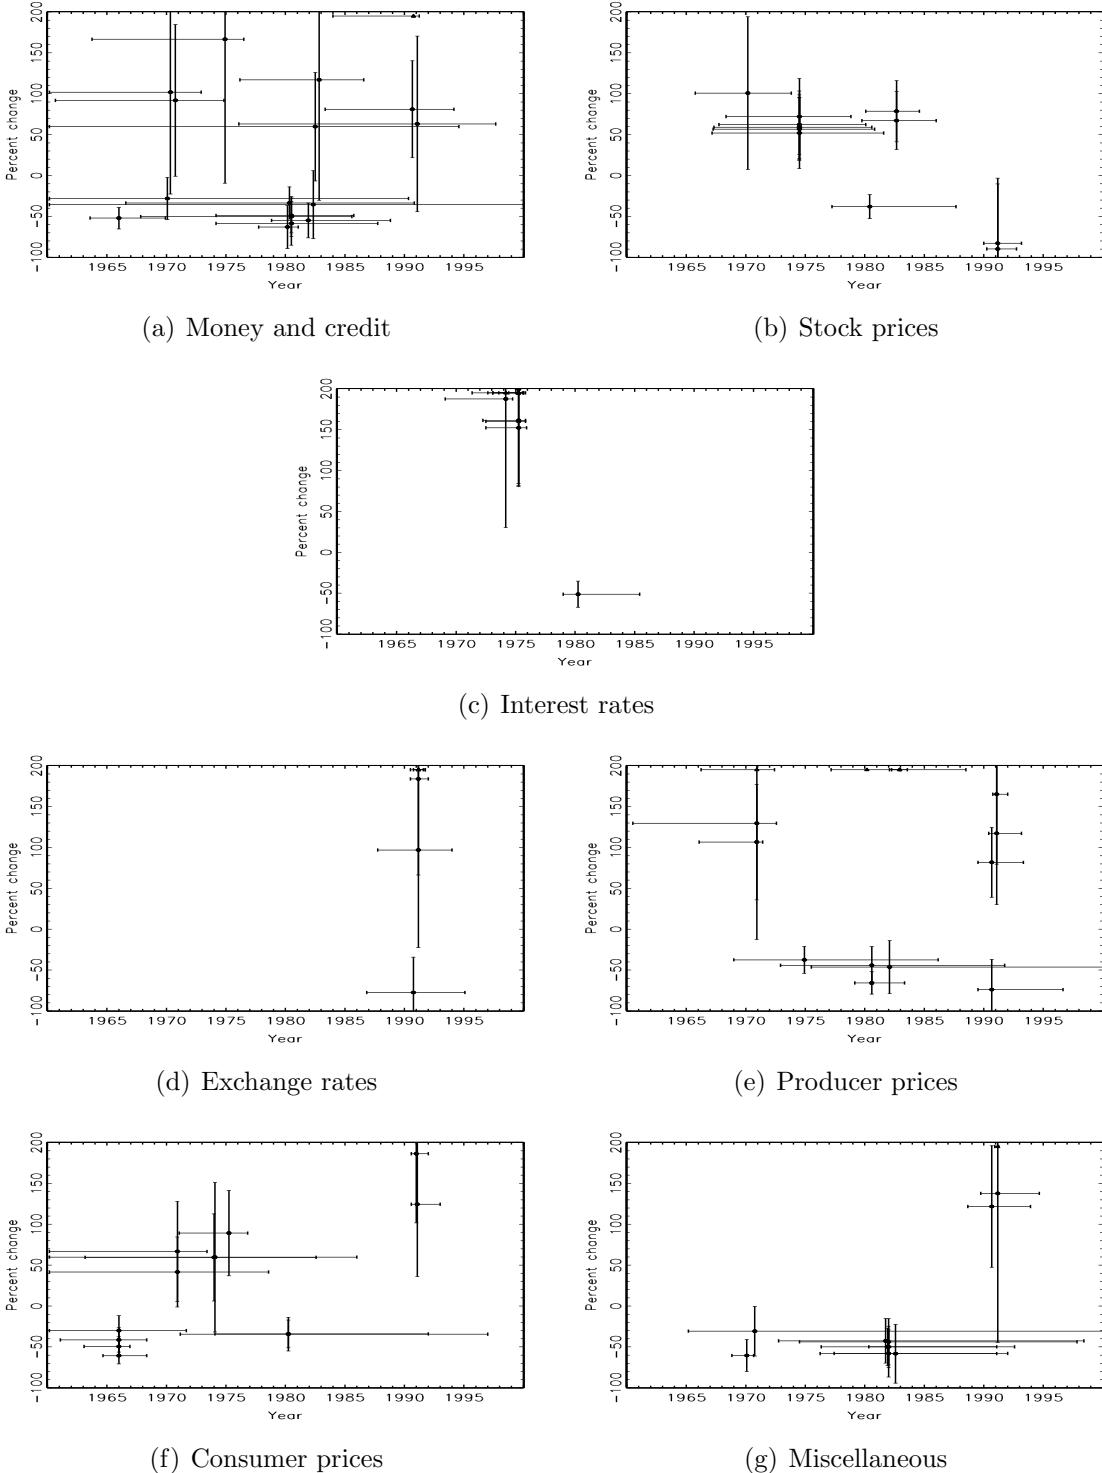

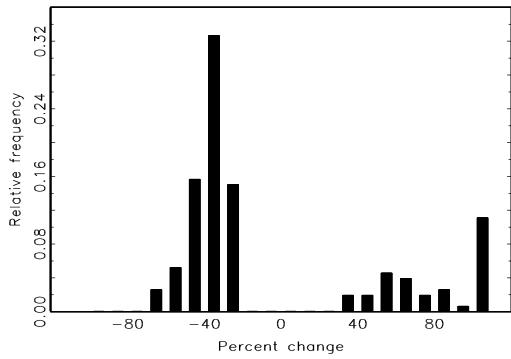

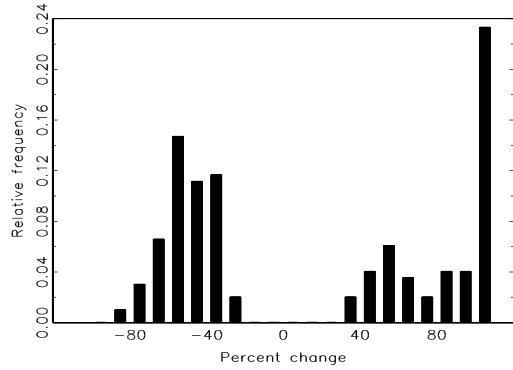

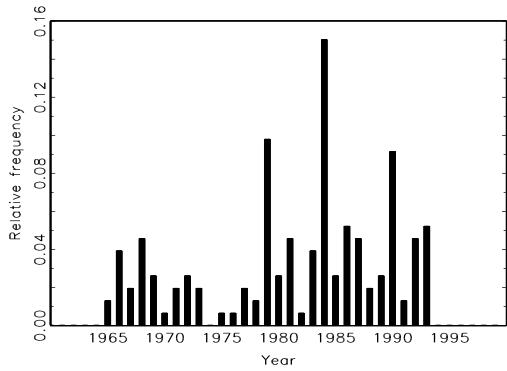

Figure 28: Scatter plots of volatility break dates against percent change in unconditional standard deviation during recessions for series for which the SupW statistic for a structural change in the unconditional volatility in expansions only is significant at the 5% level, when assuming a nonlinear unconditional mean. 90% confidence intervals for the break date and the percent change in standard deviation are included. Series for which the standard deviation more than triples are shown as triangles.

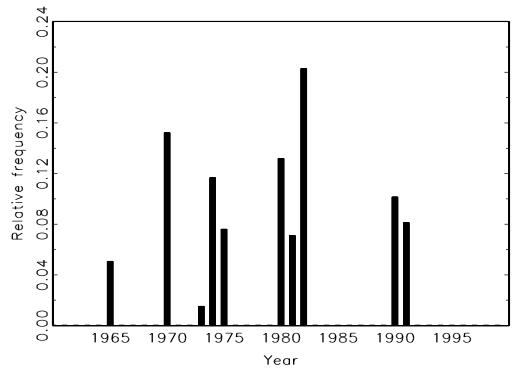

(a) Distribution of percent change in standard deviation during expansions

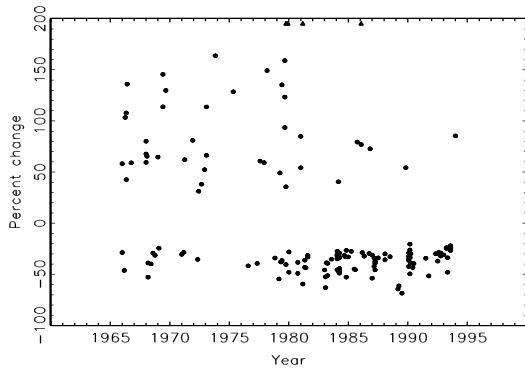

(b) Distribution of percent change in standard deviation during recessions

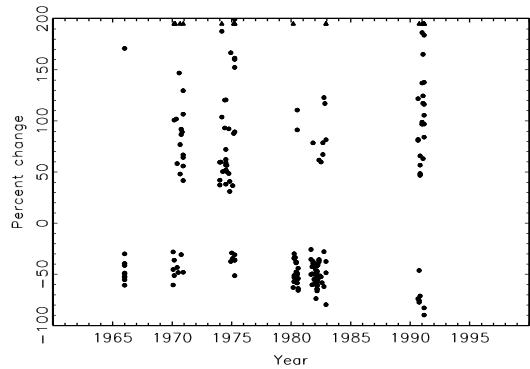

(c) Distribution of break dates for standard deviation during expansions

(d) Distribution of break dates for standard deviation during recessions

(e) Scatter of break dates against percent change in standard deviation during expansions

(f) Scatter of break dates against percent change in standard deviation during recessions

Figure 29: Characteristics of unconditional volatility breaks for series for which the SupW statistics for a structural change in the unconditional volatility in recessions and expansions separately are significant at the 5% level, when assuming a nonlinear unconditional mean with structural change during expansions. In panels (a) and (b), series for which the standard deviation more than doubles are collected in the right-most category. In panels (e) and (f), series for which the standard deviation more than triples are shown as triangles.

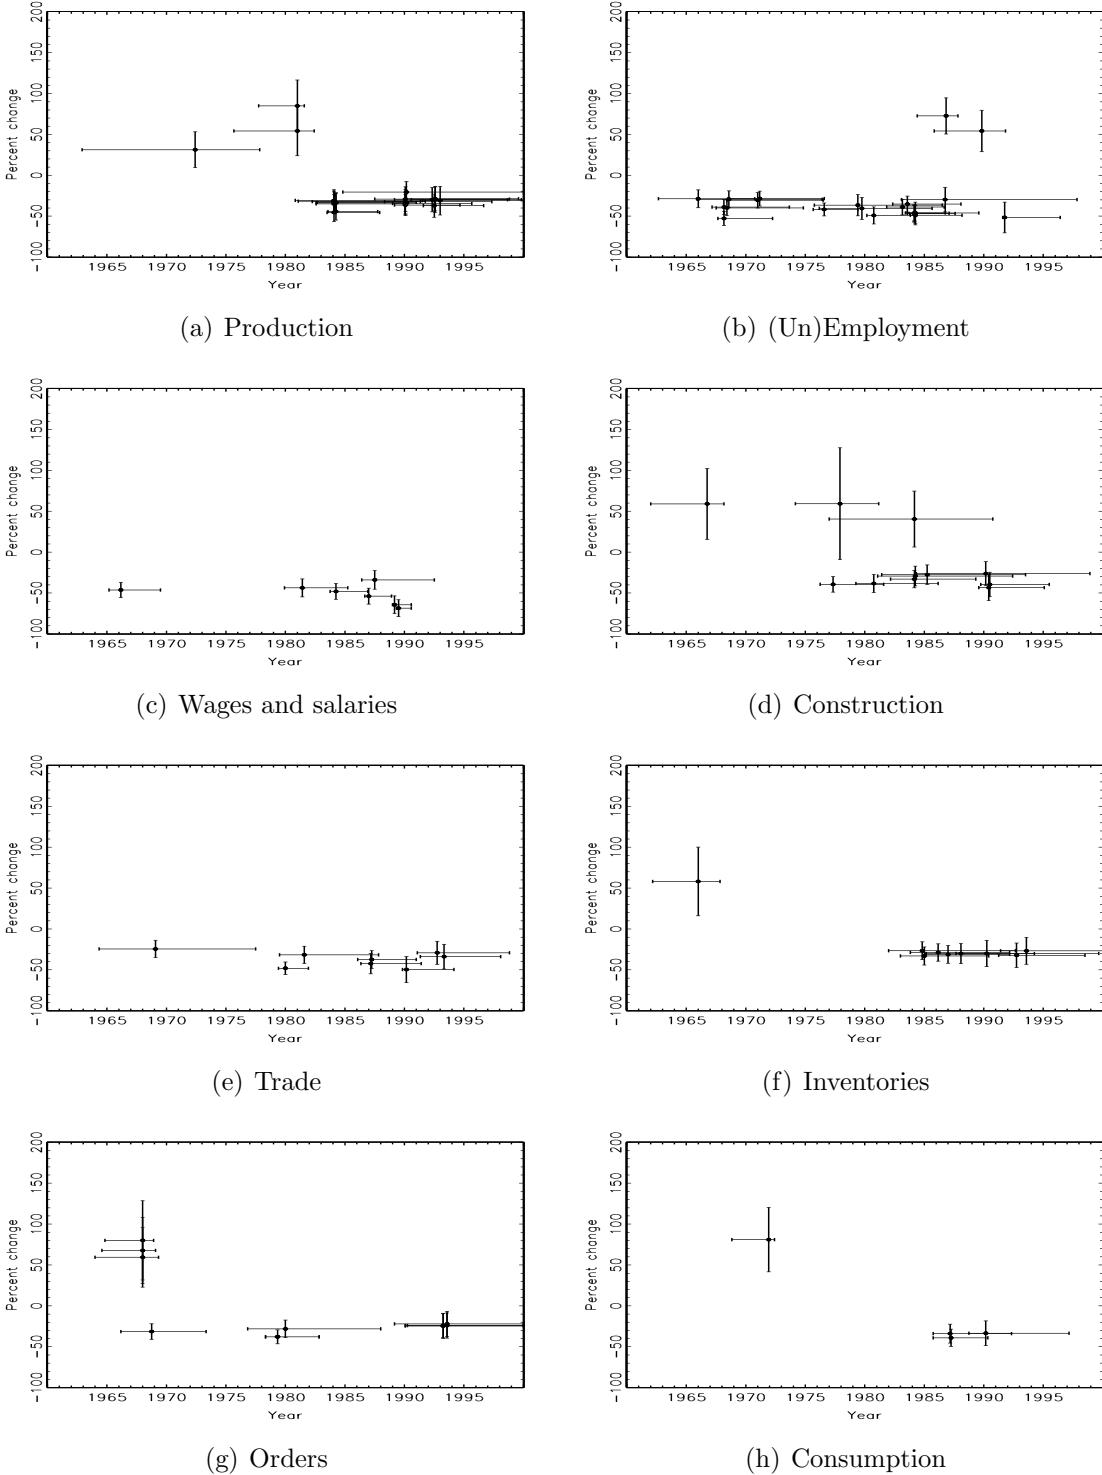

Figure 30: Scatter plots of volatility break dates against percent change in unconditional standard deviation during expansions for series for which the SupW statistic for a structural change in the unconditional volatility in expansions only is significant at the 5% level, when assuming a nonlinear unconditional mean with structural change during expansions. 90% confidence intervals for the break date and the percent change in standard deviation are included. Series for which the standard deviation more than triples are shown as triangles.

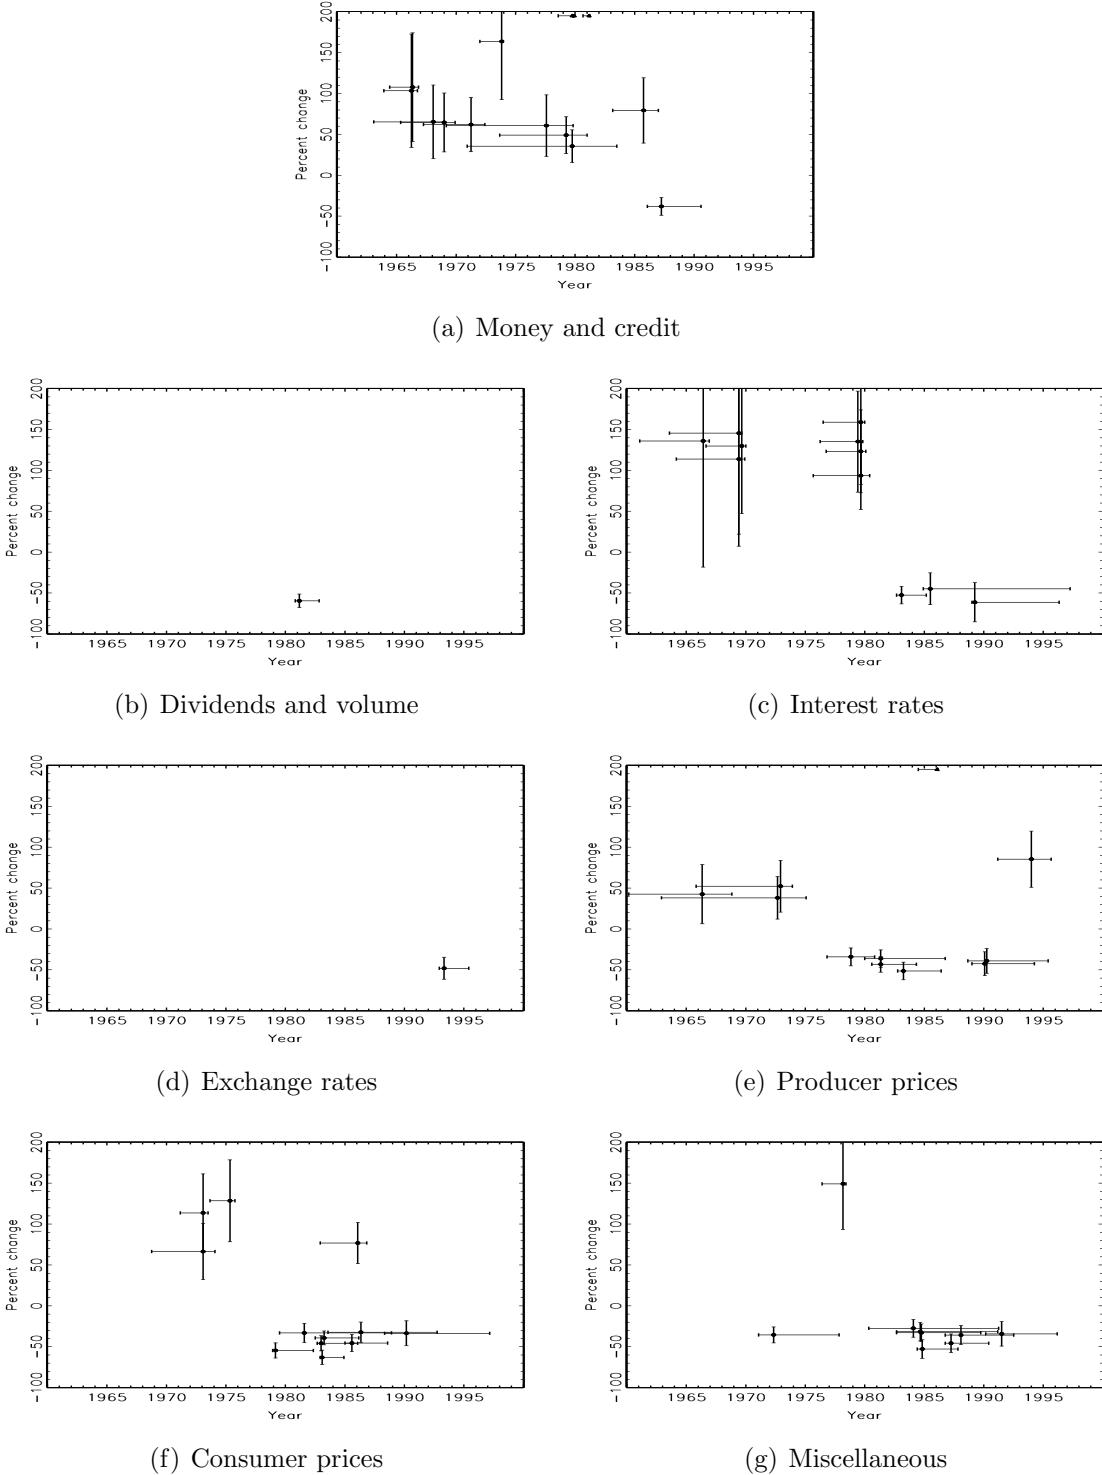

Figure 31: Scatter plots of volatility break dates against percent change in unconditional standard deviation during expansions for series for which the SupW statistic for a structural change in the unconditional volatility in expansions only is significant at the 5% level, when assuming a nonlinear unconditional mean with structural change during expansions. 90% confidence intervals for the break date and the percent change in standard deviation are included. Series for which the standard deviation more than triples are shown as triangles.

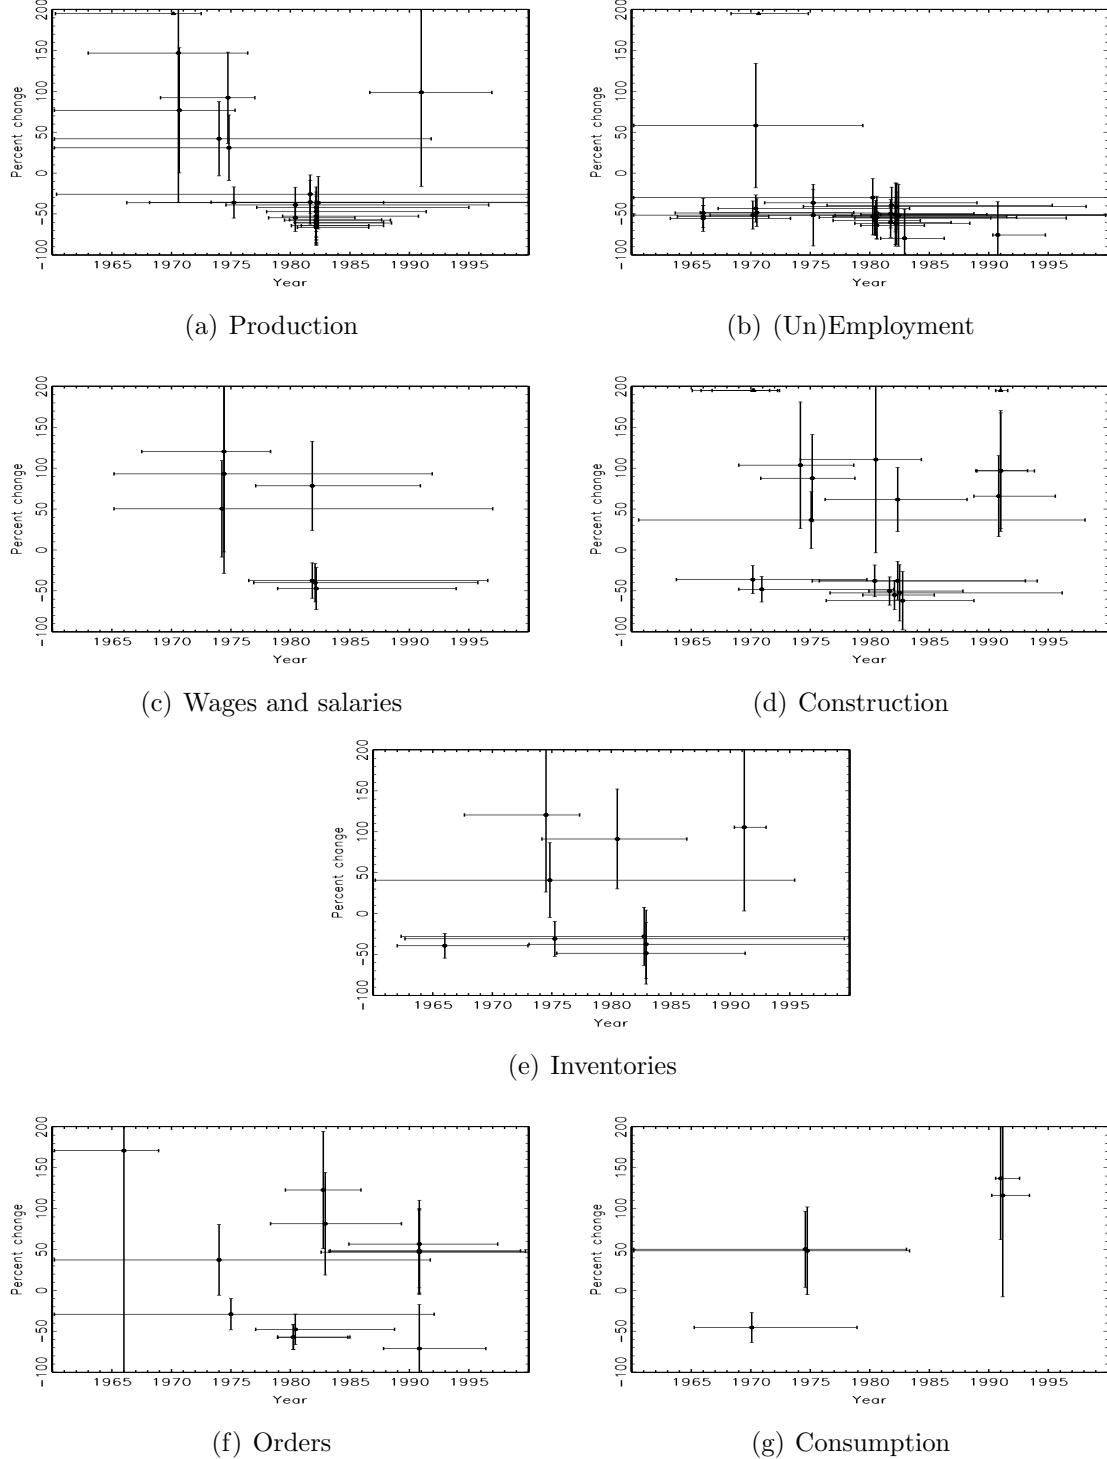

Figure 32: Scatter plots of volatility break dates against percent change in unconditional standard deviation during recessions for series for which the SupW statistic for a structural change in the unconditional volatility in expansions only is significant at the 5% level, when assuming a nonlinear unconditional mean with structural change during expansions. 90% confidence intervals for the break date and the percent change in standard deviation are included. Series for which the standard deviation more than triples are shown as triangles.

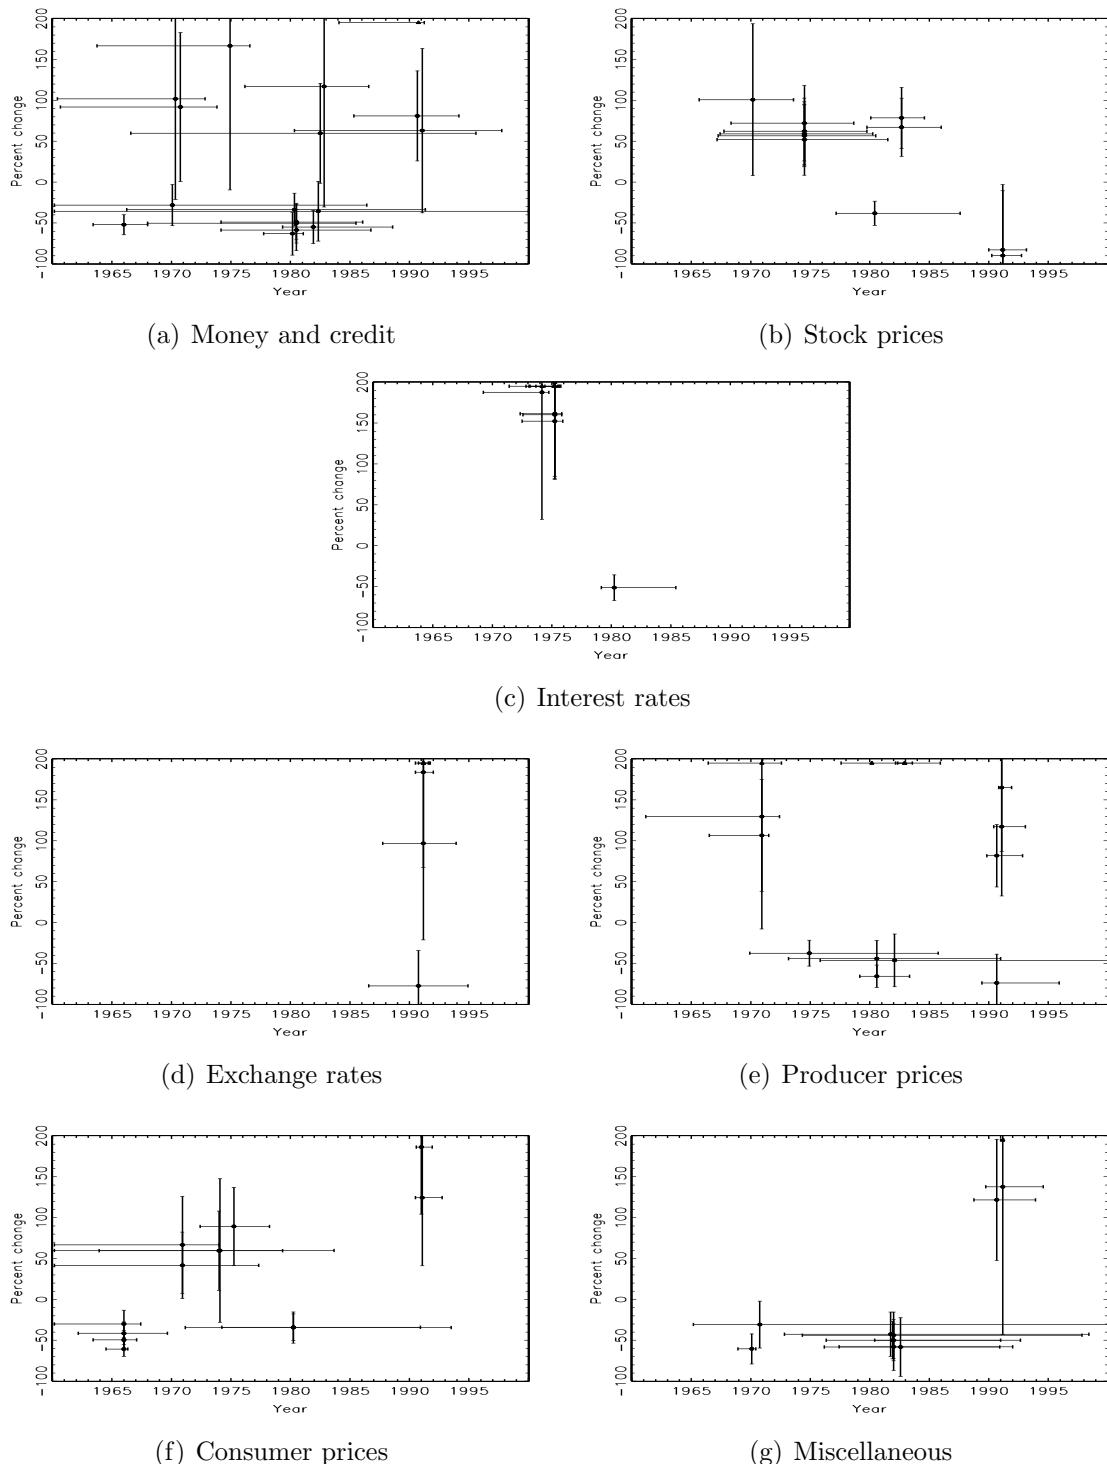

Figure 33: Scatter plots of volatility break dates against percent change in unconditional standard deviation during recessions for series for which the SupW statistic for a structural change in the unconditional volatility in expansions only is significant at the 5% level, when assuming a nonlinear unconditional mean with structural change during expansions. 90% confidence intervals for the break date and the percent change in standard deviation are included. Series for which the standard deviation more than triples are shown as triangles.
